MEMORIA TECNICA
PROYECTO MERCADO POPULAR CRISTO REY

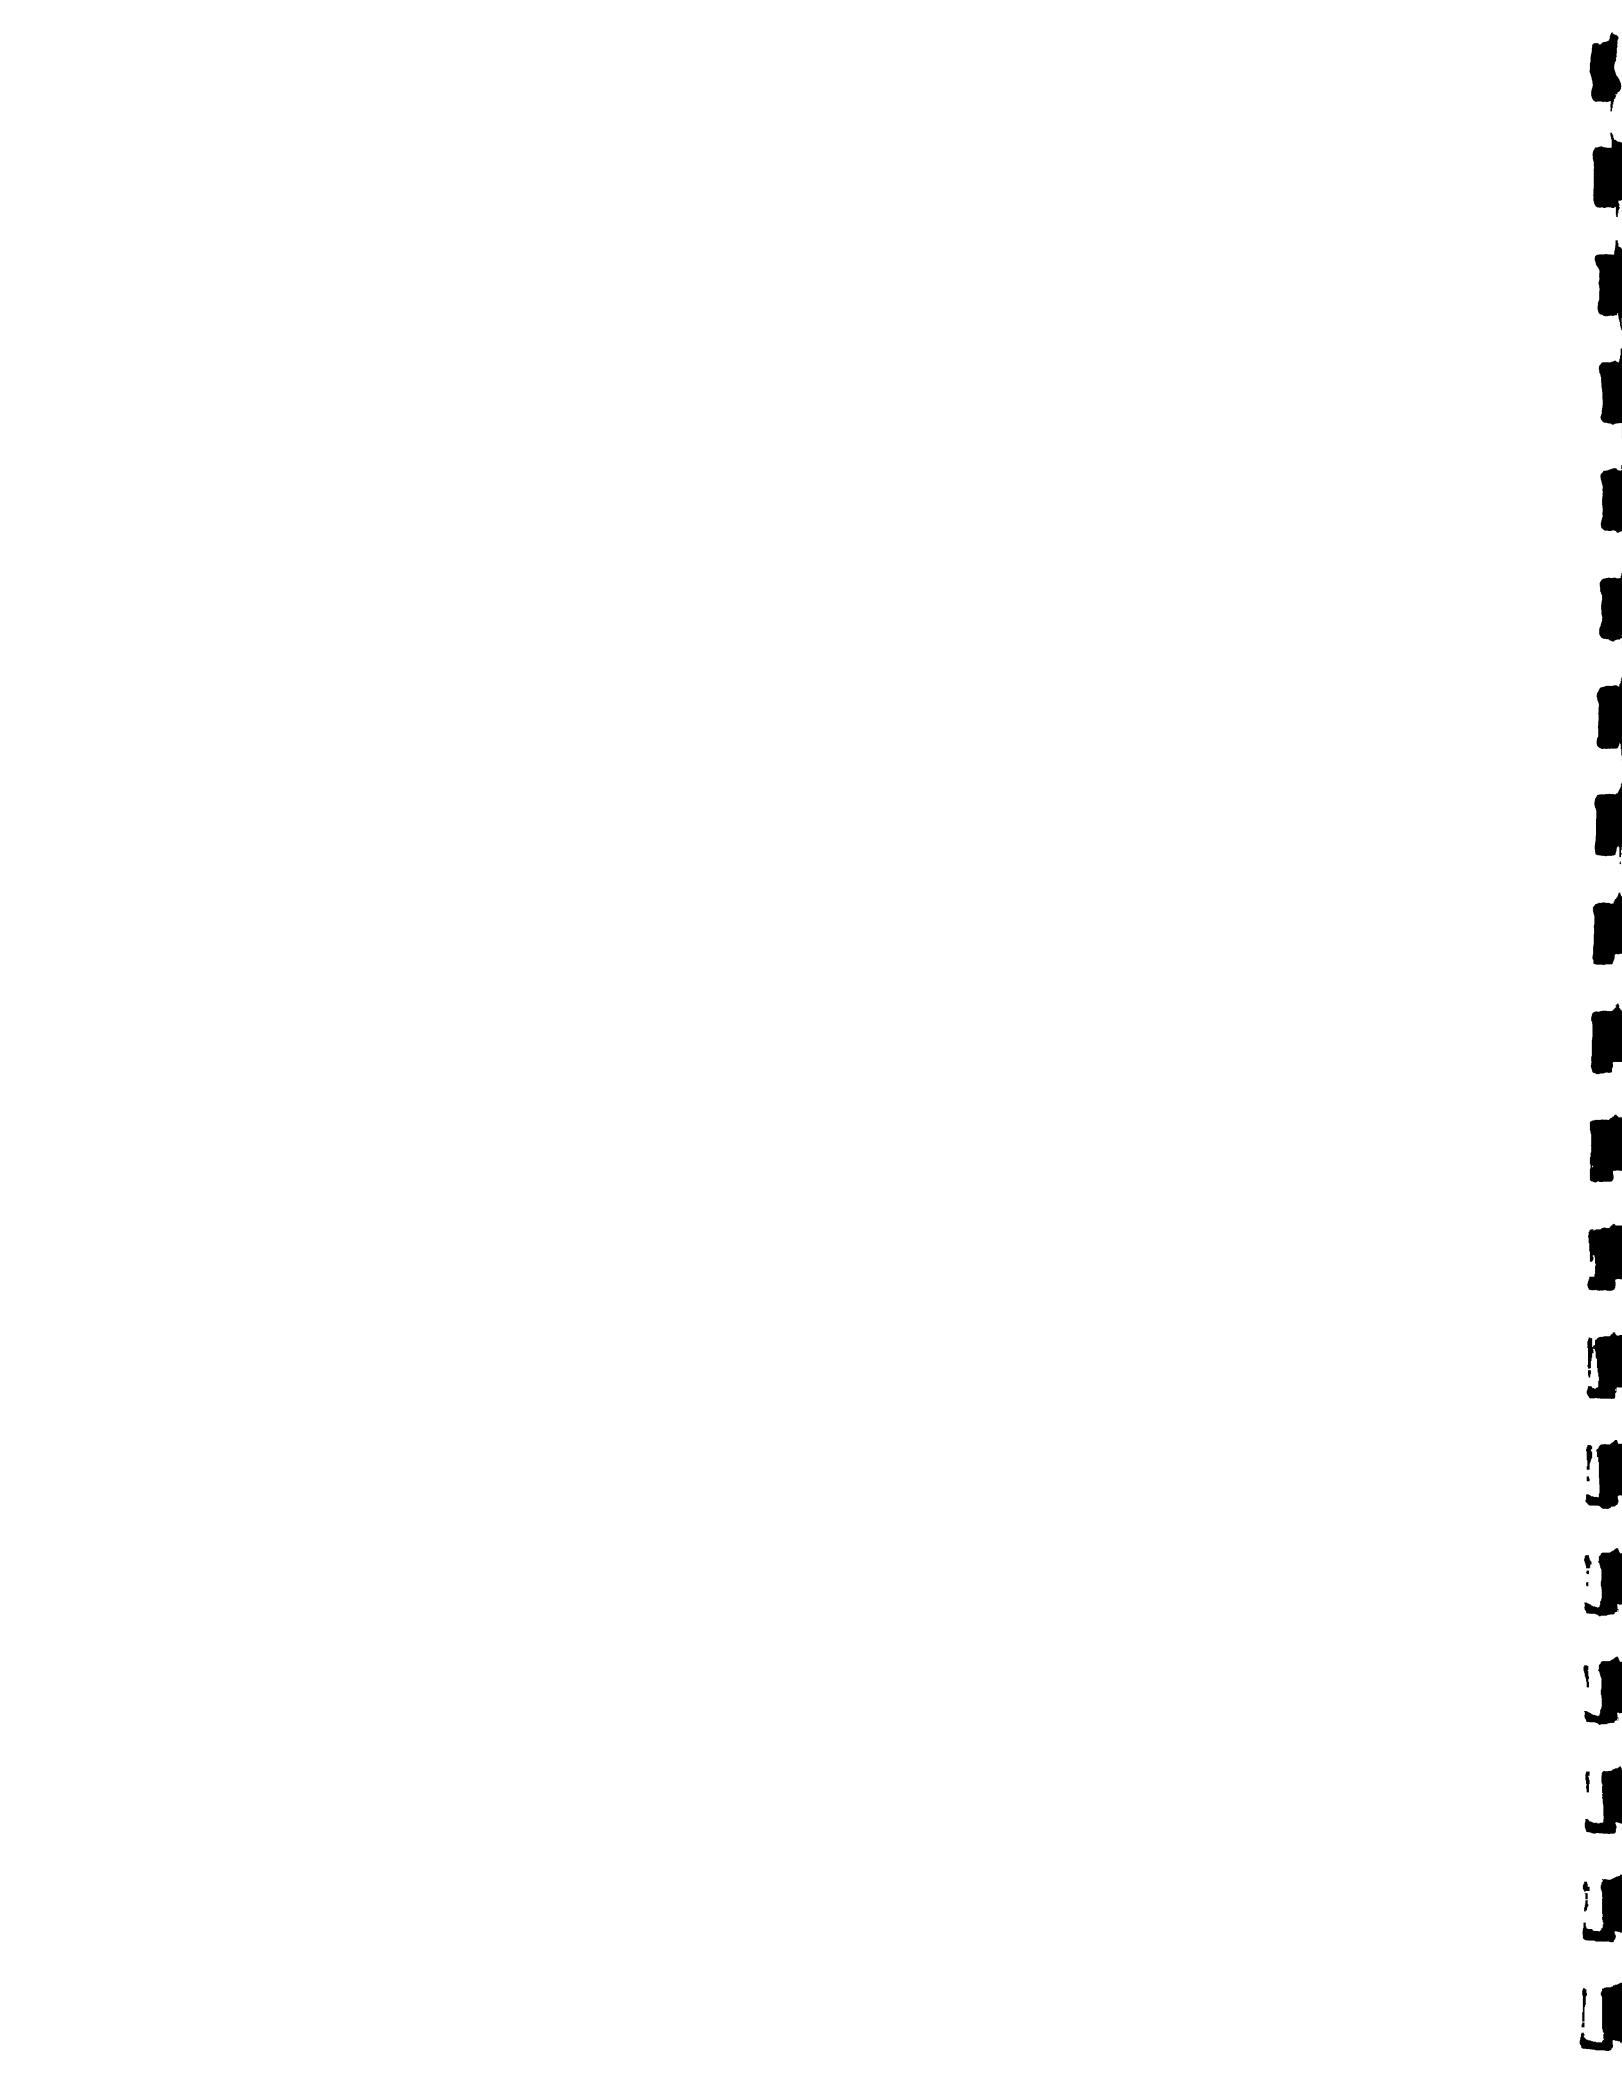

1. ANTECEDENTES GENERALES

- 1.1 Los distintos elementos que integran este proyecto arquitectónico, planos maqueta y documentos descriptivos, representan la materialización de una de las propuestas generales contenidas en el "Informe Técnico y Propuesta de Diseño para el Mejoramiento del Sistema de Distribución Urbana de Alimentos de Santo Domingo, a través de los Mercados Espontáneos", documento éste elaborado sobre la base del contrato de prestación firmado el 26 de septiembre de 1985 entre el Ayuntamiento del Distrito Nacional (ADN) y el Instituto Interamericano de Cooperación para la Agricultura (IICA), para colaborar este último en el área de formulación de proyectos para el fortalecimiento del sistema de distribución de alimentos en Santo Domingo.
- 1.2 El mencionado Informe Técnico contiene un análisis físico de cada uno de los trece (13) mercados espontáneos existentes a la fecha en la capital dominicana, así como lineamientos de propuestas de diseño para su mejoramiento espacial. Una de estas propuestas tipológicas generales se planteó en consideración de las características y particularidades observadas exclusivamente por el Mercado Espontáneo de Cristo Rey, uno de los más importantes mercados espontáneos estudiados. Esta propuesta constituyó el modelo denominado "Placita Popular" para el mejoramiento del Mercado Espontáneo de Cristo Rey para ser construido en otras áreas o barrios de la ciudad capital y en otras ciudades del interior del país que requieran una pequeña plaza barrial de productos alimenticios.
- 1.3 El Mercado Espontáneo de Cristo Rey está ubicado en el populoso barrio de Cristo Rey, en la parte norte de la ciudad de Santo Domingo, en la intersección de la Ave. San Juan de la Maguana (Calle 38) con la Arzobispo Romero (Calle 41), próximo a la intersección de las avenidas Nicolás de Ovando con Ortega y Gasset. El mismo opera en un terreno de 1505 M² en el que antes existía una pequeña plaza (área verde) del sector. Debido a la dinámica y el crecimiento experimentado durante los últimos años, el mercado también ocupa un área de aproximadamente 3,000 M² de las calles periféricas al terreno de la antigua plaza, en particular de la Calle Arzobispo Romero o Calle 41. El uso de los espacios que ocupa son totalmente distintos, pues mientras el terreno de la antigua área verde del sector ha sido abarrotada de destapadas cestas o quioscos, los terrenos de las calles periféricas a la antigua plaza son ocupados por vehículos de carga, mesas, techos de materiales ligeros tales como lona, tela, plástico, etc., y productos que se exhiben directamente en el suelo con unos 250 vendedores y/o comerciantes que integran este Mercado Espontáneo.
- 1.4 Los estudios efectuados sobre el Mercado Espontáneo de Cristo Rey señalan en este, al igual que en los otros mercados espontáneos que funcionan en Santo Domingo, una serie de deficiencias y/o problemas en el orden físico-espacial de tal gravedad, que los mismos requieren de rápida atención para el mejoramiento de la distribución de los productos perecederos que demanda la población del sector, así como para detener el deterioro físico que padece la ciudad capital, el que afecta directamente la calidad de vida de la población.

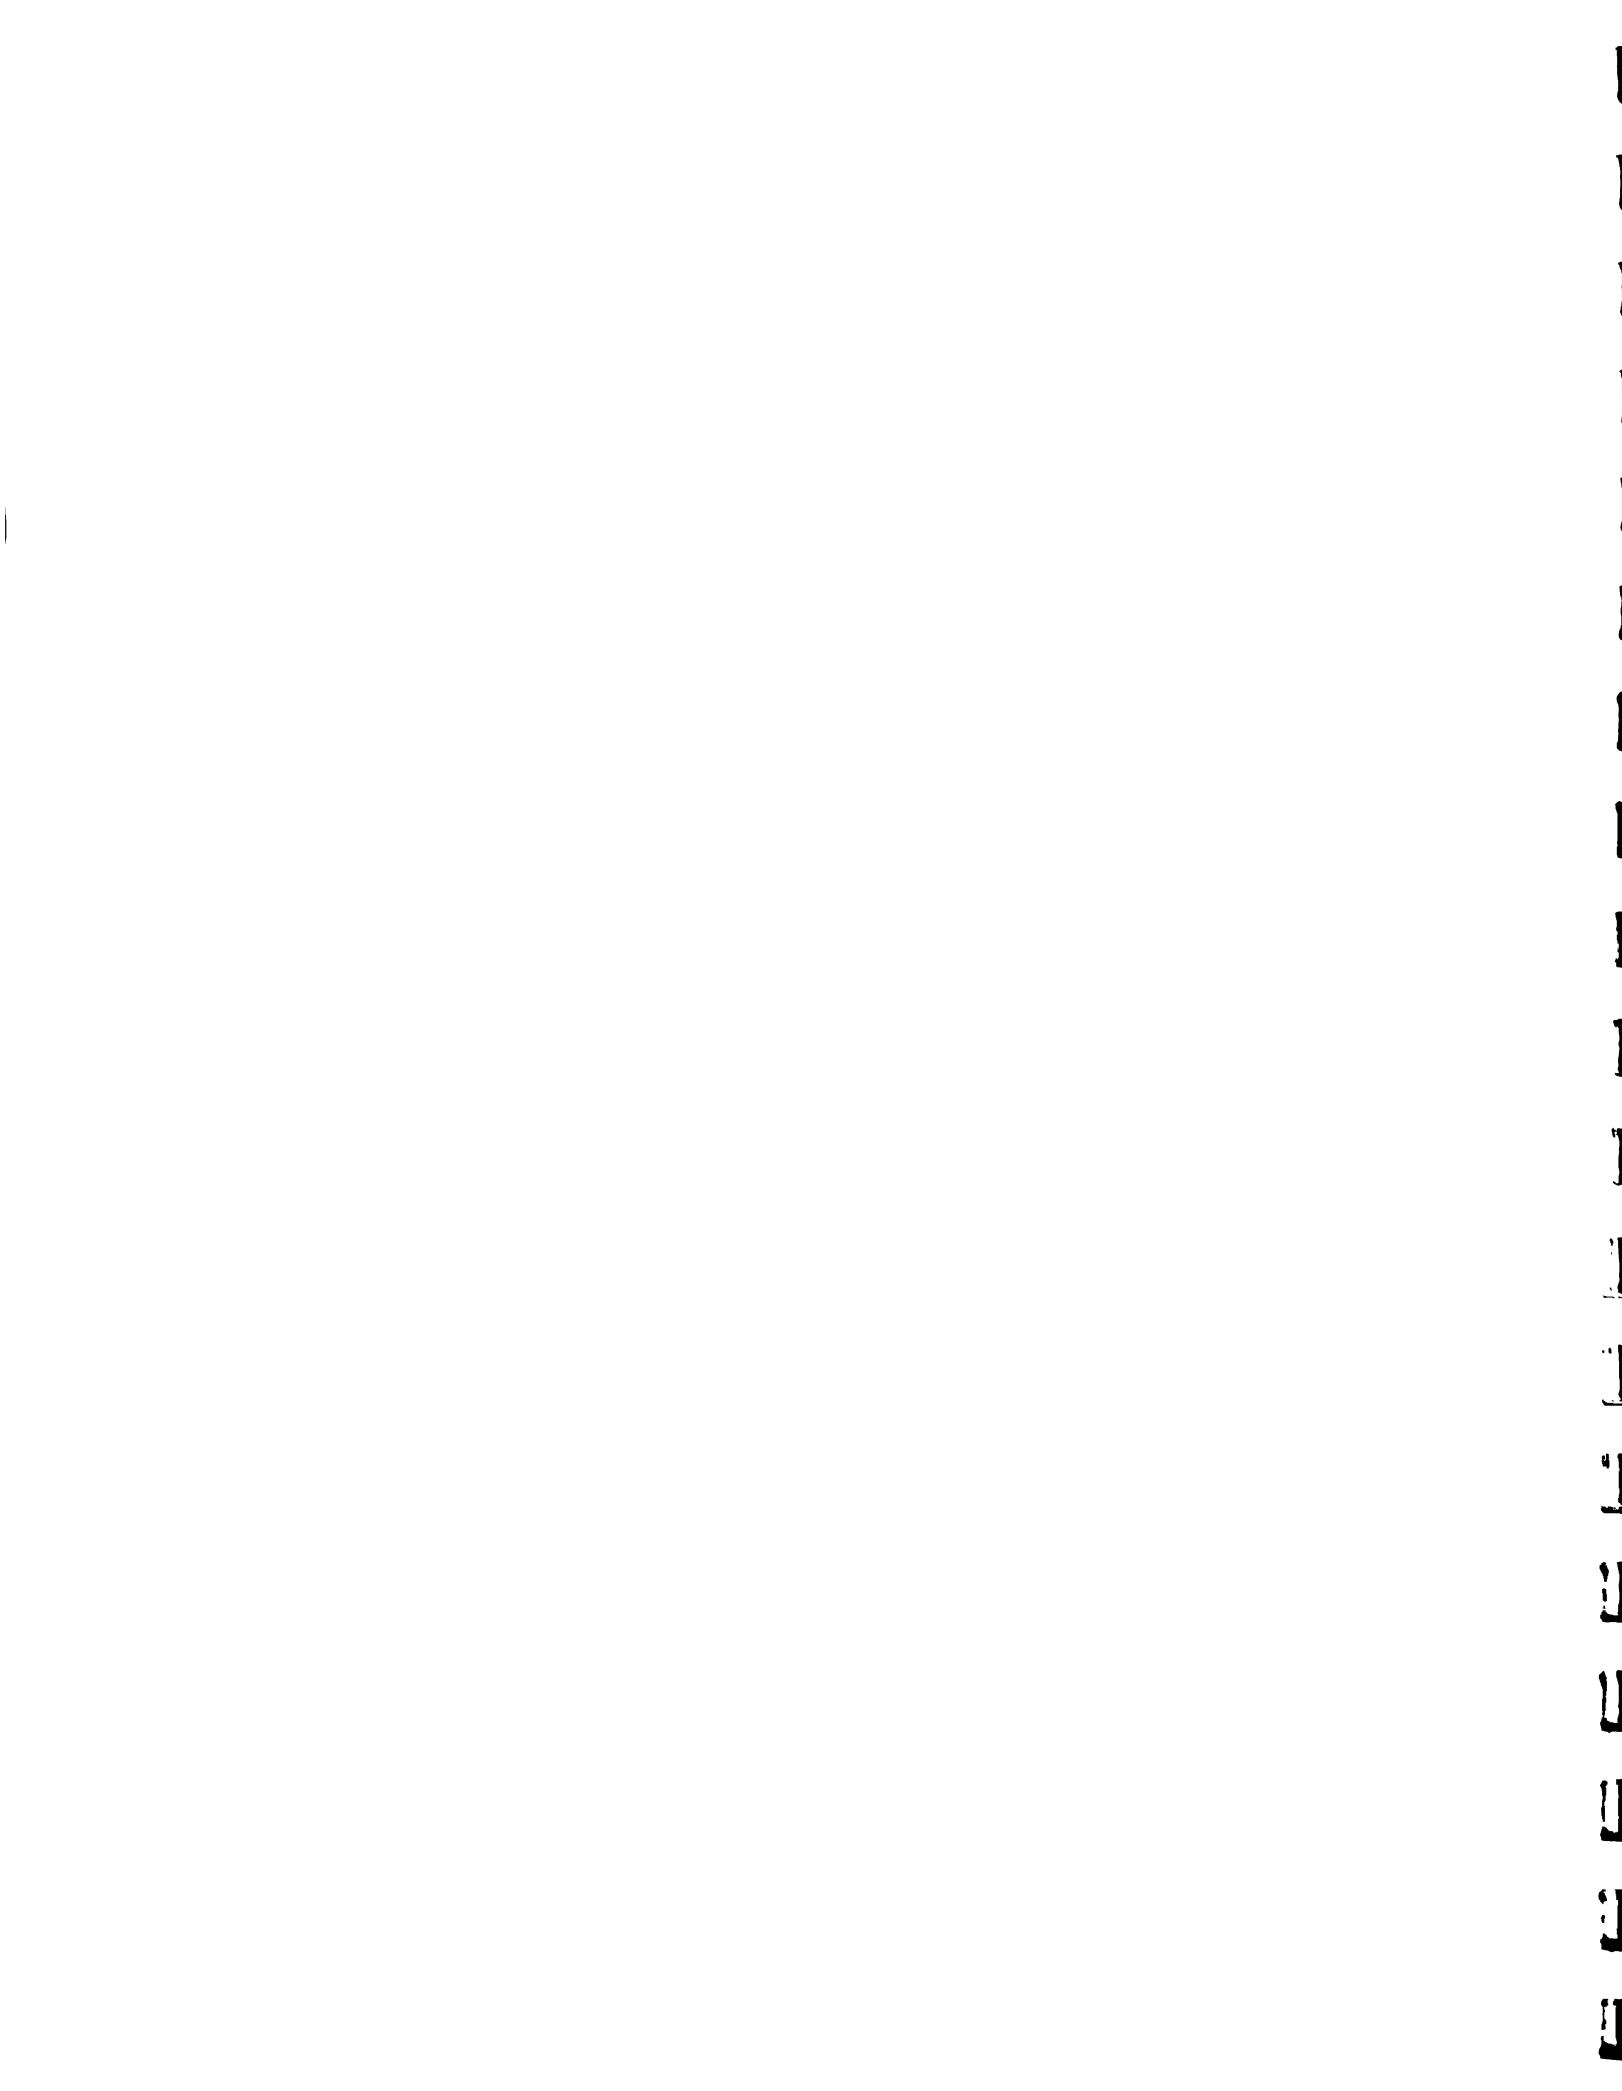

- 1.5 Los problemas más importantes que presenta el mercado son:
- Constituye un obstáculo al libre tránsito vehicular y peatonal al ocupar las aceras y parcialmente las calles; se constituye en un foco infeccioso para la población, tanto por no poseer un adecuado sistema de exhibición de los productos, como por la contaminación de los mismos con la basura y el agua sucia estancada a su alrededor;
 - Es un problema social-moral para los habitantes del sector, ya que señalan los vecinos que en horas de las noches las casetas del mercado son utilizadas como prostíbulos debido a que el lugar no es cerrado por las noches;
 - La carencia de agua también colabora para que el mercado se constituya en foco infeccioso;
 - En la parte norte del mercado existe una caja de desperdicios, la cual debido a los atrasos en recogerse constituye un basural en el medio de la calle, siendo éste el principal elemento que hace del mercado un foco infeccioso.

2. PREMISAS PARA EL DISEÑO

2.1 Las más importantes condiciones que ha de cumplir la propuesta de diseño del nuevo mercado de Cristo Rey, señaladas por la Dirección del IICA, así como otras consideraciones surgidas como consecuencia de los estudios realizados por nosotros del mercado espontáneo y del propio sector, son:

- La propuesta de mercado debe efectuarse considerando que el mismo funcionará en los terrenos destinados a la antigua plaza o áreas verde;
- El edificio a diseñar para alojar al mercado debe ser de una sola planta o piso;
- El diseño del mercado debe ceñirse a criterios de "máxima economía" en su construcción y financiamiento;
- El mercado diseñado debe permitir una fácil y rápida limpieza (lavado con manguera);
- El mercado diseñado deberá permitir la ubicación del máximo de comerciantes de los que trabajan en la actualidad en el centro de distribución de alimentos, a través de locales de venta y en área común de venta.
- El edificio diseñado deberá contemplar la dotación de baños, área administrativa y de vigilancia.
- El mercado diseñado debe asegurar el abastecimiento de agua para el lavado de los productos por los comerciantes y para la limpieza del edificio.
- El edificio del mercado diseñado debe impedir que el mismo se extienda por las calles periféricas, ocupando aceras y calles.

3. PROPUESTA DE DISEÑO

3.1 La propuesta de diseño presentada se desarrolló sobre la base de:

- Una zonificación simple en base a dos grandes áreas de ventas para alojar a los comerciantes o vendedores por tipo de mercancía: un área central común para vendedores de productos perecederos y otra periférica a la primera, con locales para la venta de productos procesados y cárnicos. Una organización de la circulación del público y vehicular en forma de circuito con frentes precisos de entrada y salida. Para esto se limitaron los accesos del público al mercado a dos frentes, y los mismos fueron ubicados en las esquinas del lado Este del terreno, por constituir esta zona en la actualidad el mayor foco de atracción del mercado espontáneo. Asimismo, el acceso para vehículos (carga y descarga) se ubicó en la parte Oeste del solar, al lado de la cancha deportiva por ser ésta en la actualidad, la de menor actividad comercial.
- Una definición de un cierre periférico a toda el área del mercado conformado por una verja metálica como elemento físico que delimita el mercado y evite su expansión y rápido deterioro.
- Un diseño cerrado pero transparente que asegure una buena iluminación y ventilación en todo el perímetro del edificio, que se complementa con la iluminación central que permiten los domos o cúpulas ubicados en el techo, que aseguran la luz en el área de venta común del mercado.
- La forma simple del techo (a 4 aguas), permite recoger el agua de lluvia a través de una canaleta metálica en toda la periferia del edificio recogiéndola y conduciéndola a una cisterna ubicada en el área de servicio. Con esto se asegura el abastecimiento del líquido requerido por las distintas actividades del mercado.
- La dotación de un sistema de desague por toda el área del mercado sobre los ejes de circulación del público, permitirá su lavado y rápido desague.
- El techo, diseñado a base de estructuras de tijerillas y vigas metálicas soportadas por columnas de hormigón armado y una cubierta liviana de planchas de aluminio o alusín, nos deja una planta libre para a través de ligeras divisiones conformar los distintos espacios del mercado con tales como locales de venta, baños, oficinas administrativas, vigilancia, etc.
- El edificio tendrá un tratamiento con materiales económicos que permita su uso por parte del público y su fácil mantenimiento.

MEMORIA DEL CALCULO

Las estructuras para el proyecto del mercado IIICA-ADN consisten en cubiertas metálicas apoyadas sobre columnas de hormigón armado. Los muros de bloques se usan básicamente como cierres en divisiones interiores y exteriores.

La porción central de la edificación está formada por una cubierta reticular, con planta libre de 24 X 28 metros, bordeada por columnas de hormigón armado (0.20 X 0.20) que la apoya perimetralmente. Dicha cobertura la conforman tijerillas o corchas de angulares metálicos, en acero A36, que a su vez, soportan correas de perfiles "Z" de 8" X 3" X 1/16", las cuales, espaciadas a un máximo de 1.30 M (en proy. horz), sostienen la techumbre propiamente de planchas onduladas de "Aluzine" calibre 26. Se recomienda este último material no solo por lo económico, sino que al instalarse en planchas corridas de más de 13 M, permitiría una mayor fijación ante las acciones del viento, presentando además mejores características para evitar filtraciones.

Las columnas principales vienen arriostradas superiormente por tijerillas horizontales, mientras que, en sus fundaciones, se disponen zapatas continuas en todo el perímetro.

La cubierta central fue calculada considerando su disposición tridimensional, luego proporcionándose cada miembro o elemento de acuerdo a las fuerzas particulares.

En zonas aledañas, en lugar de tijerillas, se usan perfiles sólidos, donde la rigidez viene provista por un sistema de vigas y dinteles de hormigón armado:

Para todo el hormigón estructural se especifica una resistencia a la compresión, a los 28 días, de 180 Kg/cm², mientras que para las varillas de refuerzo se indica un límite de fluencia de 2,800 Kg/cm². Para las piezas laminadas se requiere un acero A36 con 2,500 Kg/cm² (36,000 libras por pulgada cuadrada).

Las especificaciones para esta edificación se completan con las notas constructivas y los detalles estructurales. En los cálculos estructurales se presentan al final, algunas observaciones sobre las tijerillas, pues en caso de no aparecer los perfiles detallados en el comercio local, es posible prepararlos de tolitas o planchuelas, pero considerando la confección y erección de estas piezas con contraflechas razonables, aproximadamente de un tercio de las deformaciones enlistadas en los anexos de los cálculos estructurales.

Analisis de la Cubierta Reticular a
Cargas Verticales y de Viento** pags. A-1
a A-3

11

Cálculos Estructurales
proj. Mercado Barrial

1.0 Cubierta Metálica Central

1.0.1 Análisis de Cargas Verticales

a) Considerando una inclinación de aprox. 20% ($\alpha \approx 16^\circ$, $\cos \alpha \approx 0.96$)

$$\text{Peso "Aluzinc," Calibre 26} = 5 / 0.96 = 5.2 \text{ Kg/m}^2$$

Peso Correas de perfiles

$$\text{"Zeta, } 8'' \times 3'' \times \frac{1}{16} \text{ " } 1.50 = \frac{14}{16} \frac{(2.54)^2}{0.96} \frac{7850}{10000(1.5)} = 3.1 \text{ "}$$

* Peso de tejerillas Metálicas - n

$$\frac{15}{0.96} (2 \times 14.0 + 12.0 + 2 \times 12.0 + 17.3 + 2 \times 17.3) \frac{1}{12.0(14.0)} = 10.8 \text{ "}$$

$$w_0 = \frac{19.1 \approx 20}{19.1 \approx 20} \text{ Kg/m}^2$$

$$\text{Sobrecarga, } w_L = 50 \text{ Kg/m}^2$$

∴ En Estado de Servicio la carga total vertical será de 70 Kg/m²

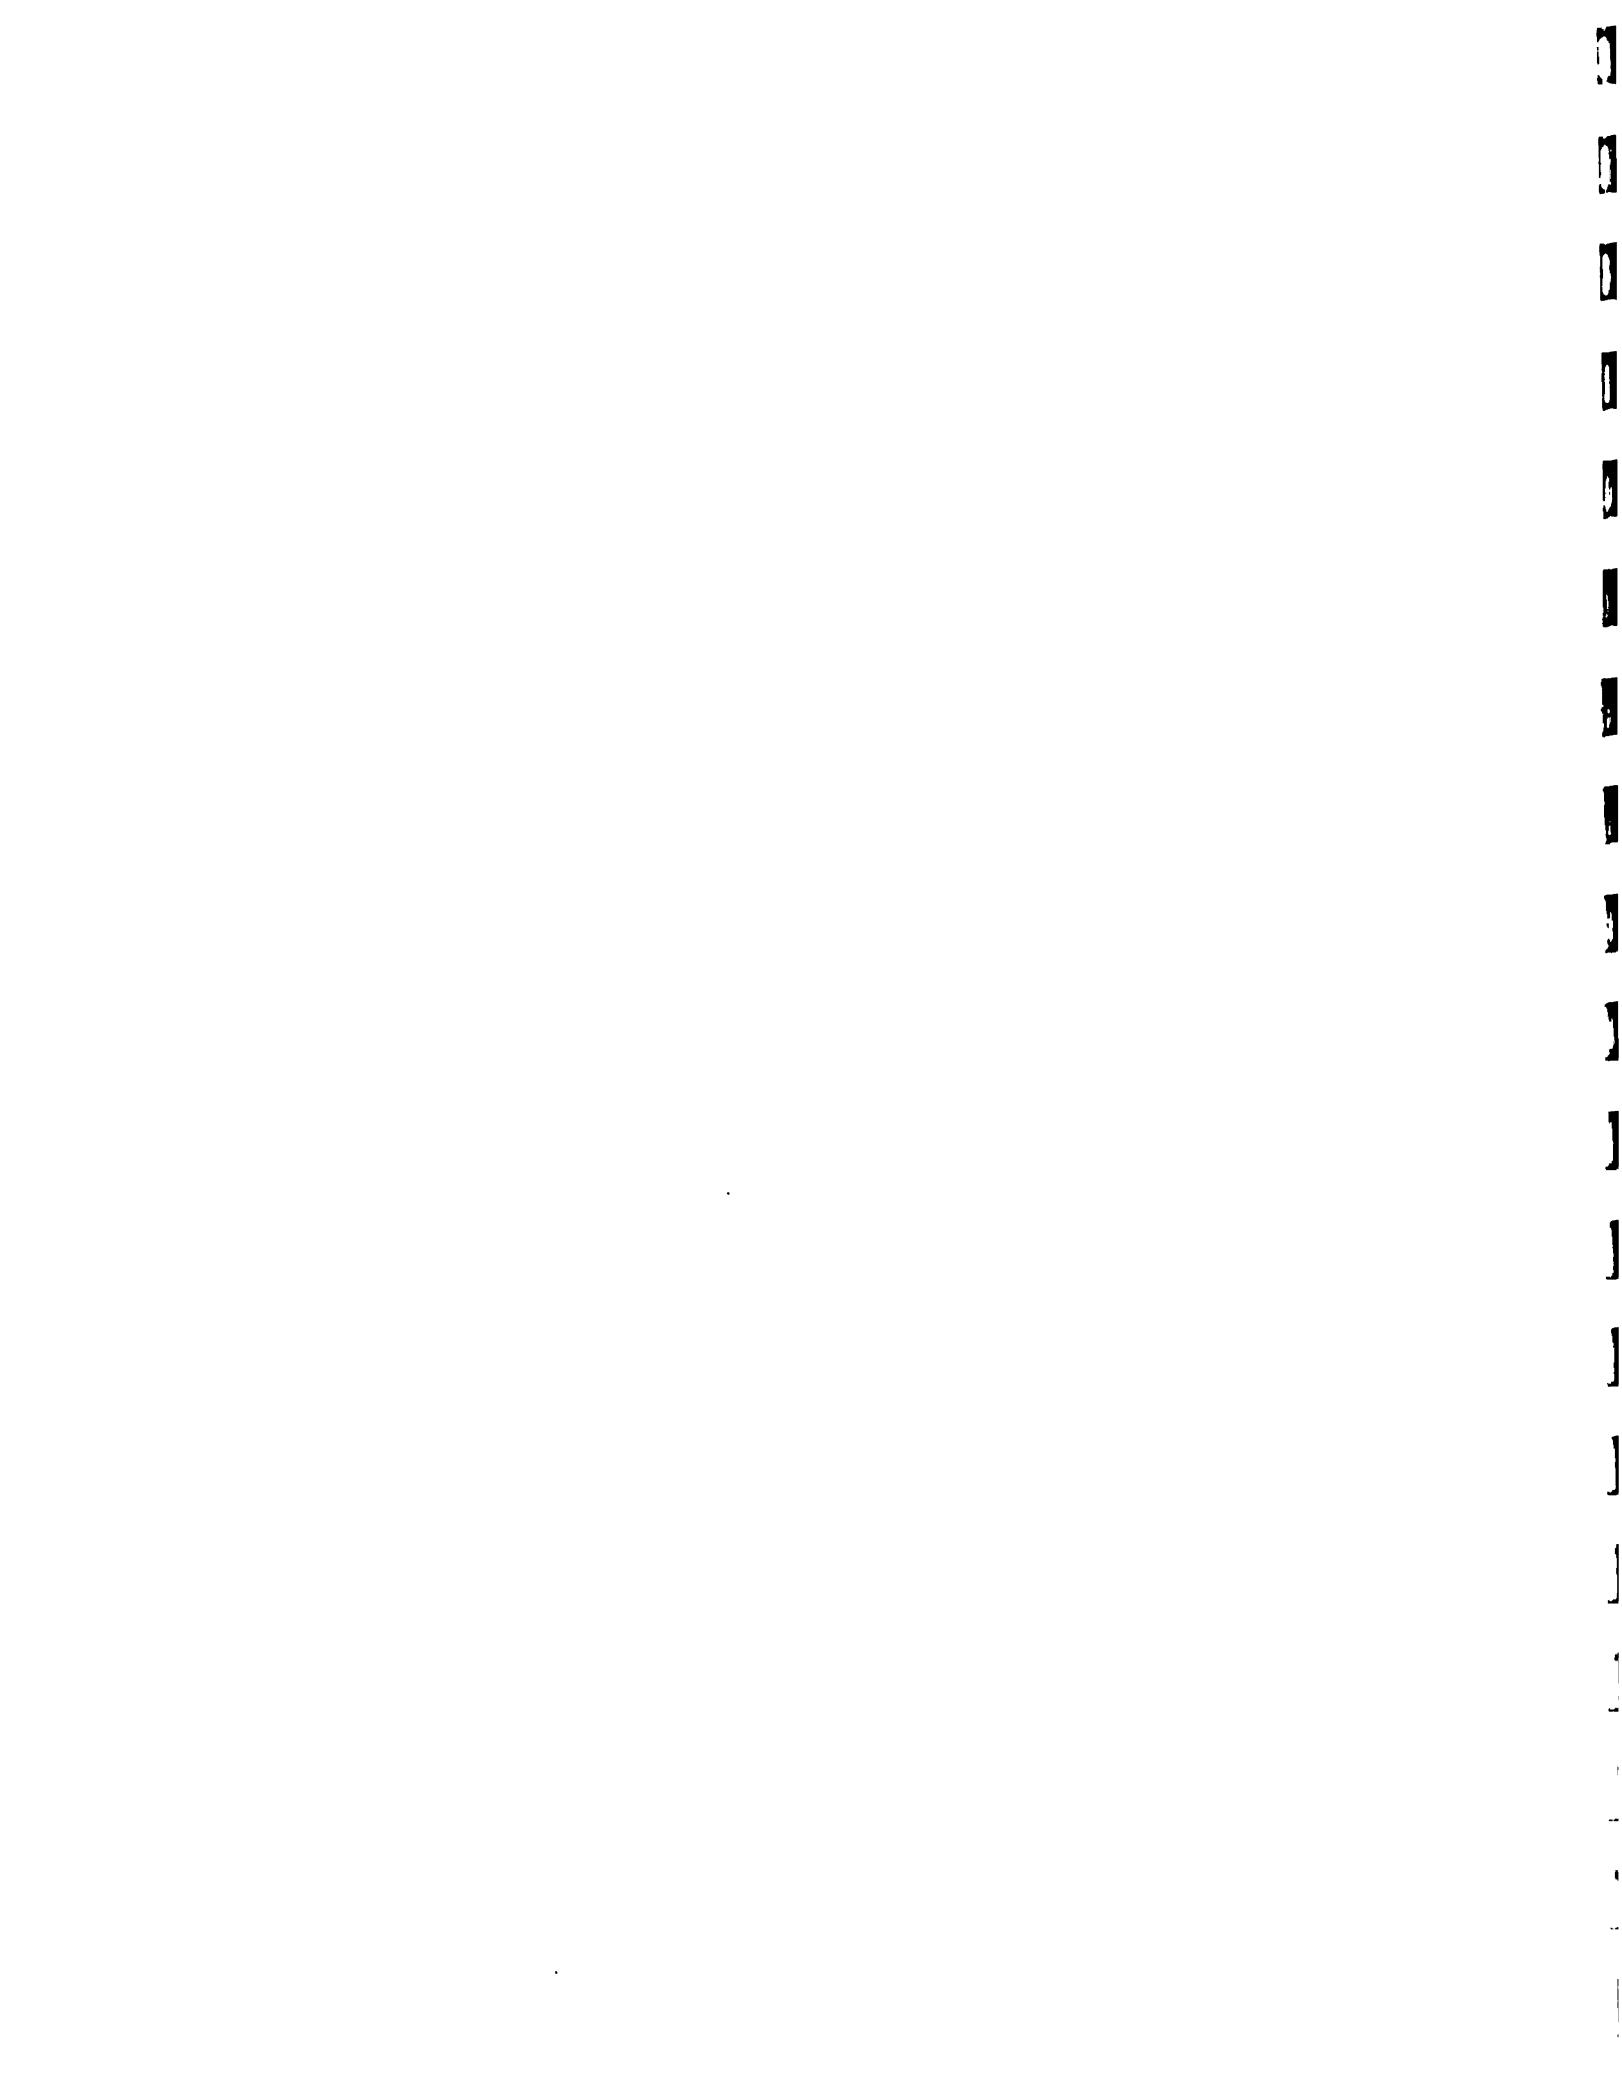

b) Como esquema estructural principal se adopta el de una estructura espacial reticular, como muestra la planta de la pag. 2, con una altura central de 4.25 m sobre los nudos perimetrales, luego comprobándose aisladamente sus miembros para las secciones longitudinales de las correas tipo "Zeta". De esta manera, considerando primera vez las cargas concentradas en los nudos indicados, se tendría por áreas tributarias:

$$\text{nudo 4} = \text{nudo 6} = -(A_{\text{nud. 4}} \text{atrib. aprx}) w = -62.0 \times 70 = -4340 \text{ Kg} \\ \approx 4.5 \text{ Ton}$$

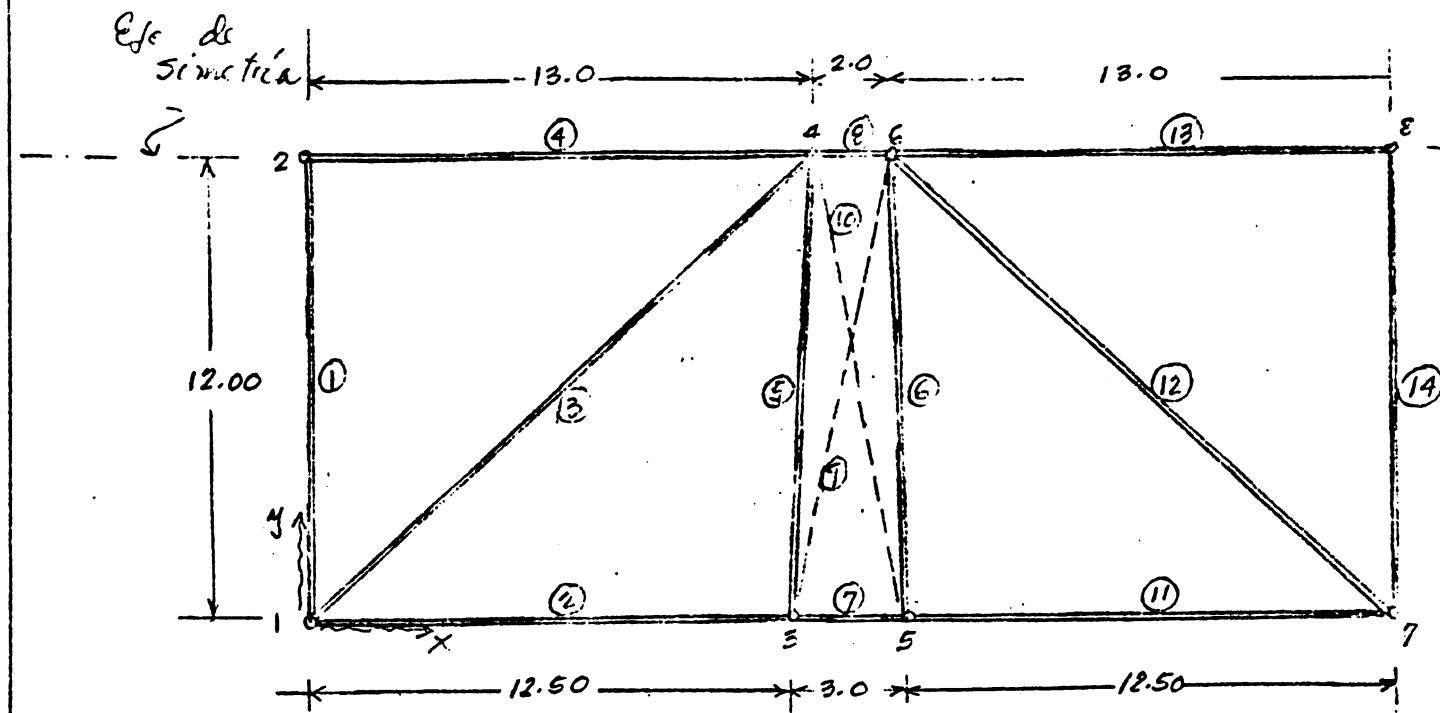

Notas: 1.- Esta área tributaria correspondería aproximadamente entre a: $7.50 \times 8.27 \text{ m}^2$. En la sección 1.04, pag. 9, luego del diseño de las tejerillas, se comprueba que esta carga es algo menor, de 3194 Kg (para un área de $3194 / 70 = \approx 46 \text{ m}^2$). El análisis se plantea considerando con la carga mayor.

2.- Las cargas concentradas sobre los demás nudos mostrados, al coincidir con los apoyos de la cubierta, no se incluyen en el análisis de conjunto.

* asumiendo 30 Kg/m para el peso de tejerillas principales, 15 kg/m para las rielas, etc.

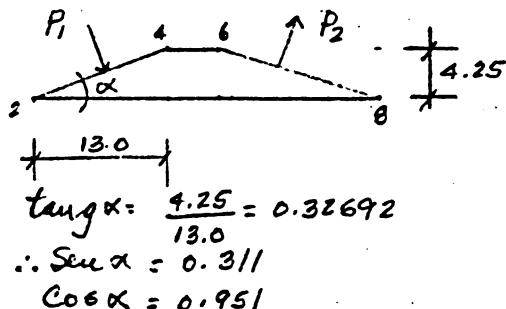

Cubierta Puntual

Semi-planta Estructural de la Cubierta

c) En el Anexo "A" se muestran los Datos y Resultados del Análisis Bajo Cargas Verticales de la Cubierta Puntual, usando el Programa SPAT (spatrat/Truss)

1.02 Análisis de Cargas de viento

a) para la dirección x, la estructura de la cubierta estaría sujeta a una presión de viento de

$$P = 160 Z U KC$$

donde $Z = LL = k = 1.0$

$$C_1 = 1.2 \sin \alpha - 0.4$$

$$C_2 = -0.40$$

con los coeficientes anteriores puede determinarse:

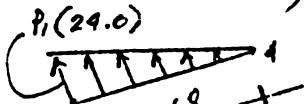

$$P_1 = [1.2(0.311) - 0.4] 160 = -4.3 \text{ kg/m}^2$$

$$P_2 = -0.4(160) = -64 \text{ kg/m}^2$$

Siendo $L_{2-4} = \sqrt{(4.25)^2 + (3.0)^2} = 5.168 \text{ m}$, la longitud de la líneal se de 2 a 4, la Carga nodal en 4 por efecto de P_1 será de:

$$4.3(24.0)(5.168)(1/3) = 235.3 \text{ kg}$$

$$\text{Paraboloide } r_{21} = 0.951(235.3) = 222.4 \text{ kg}$$

Cubierta Reticular

En el nudo 6, la reacción nodal por efecto de P_2 sería de

$$\frac{64}{4.3} (224) = 3334 \text{ kq}$$

$$\text{comp. vert} = 0.951(3334) = 3171 \text{ kq} \uparrow$$

$$" \text{ Horz} = 0.811(3334) = 1037 \text{ kq} \rightarrow$$

b) Incluyendo un peso propio de 20 kq/m^2 , las cargas por nudo serían:

nudo 4: $F_x = -0.073 \text{ ton}$

$$F_z = +0.224 - 62.0(0.02) = -1.016 \text{ ton}$$

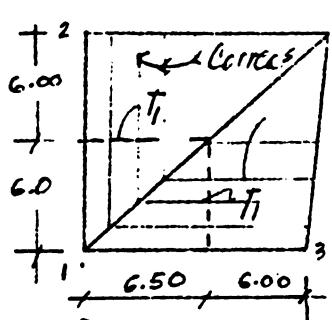

nudo 6: $F_x = +1.037 \text{ ton}$

$$F_z = +3.171 - 62.0(0.02) = +1.931 \text{ ton}$$

c) para arriostrar lateralmente la cubierta, auto cargas de viento. Las tejerillas perimetrales se integrarán con las columnas de H.A., formando póticos. Según x, a los nudos 1-3-5-7 se les proveerán de restricciones al desplazamiento, como aparece en el cuadro "A", pag.

1.03 Diseño de Elementos en Cubierta Reticular

a) Piezas Secundarias T₁

Estos elementos se disponen (como muestra la fig.) para mantener un rango máximo en las correas tipo "Z" de 6.00 y 6.50 m., respectivamente.

$$w_1 = w_2 = 70 \times 3.0 = 210 \text{ kq/m}$$

$$M_{max} = .1283 \frac{w_1 L^2}{2} + 0.97 \frac{w_2 L^2}{8}$$

$$= [.1283 (\frac{1}{2}) + 0.97 (\frac{1}{8})] (210)(6.5)^2 = 1645 \text{ kq-m}$$

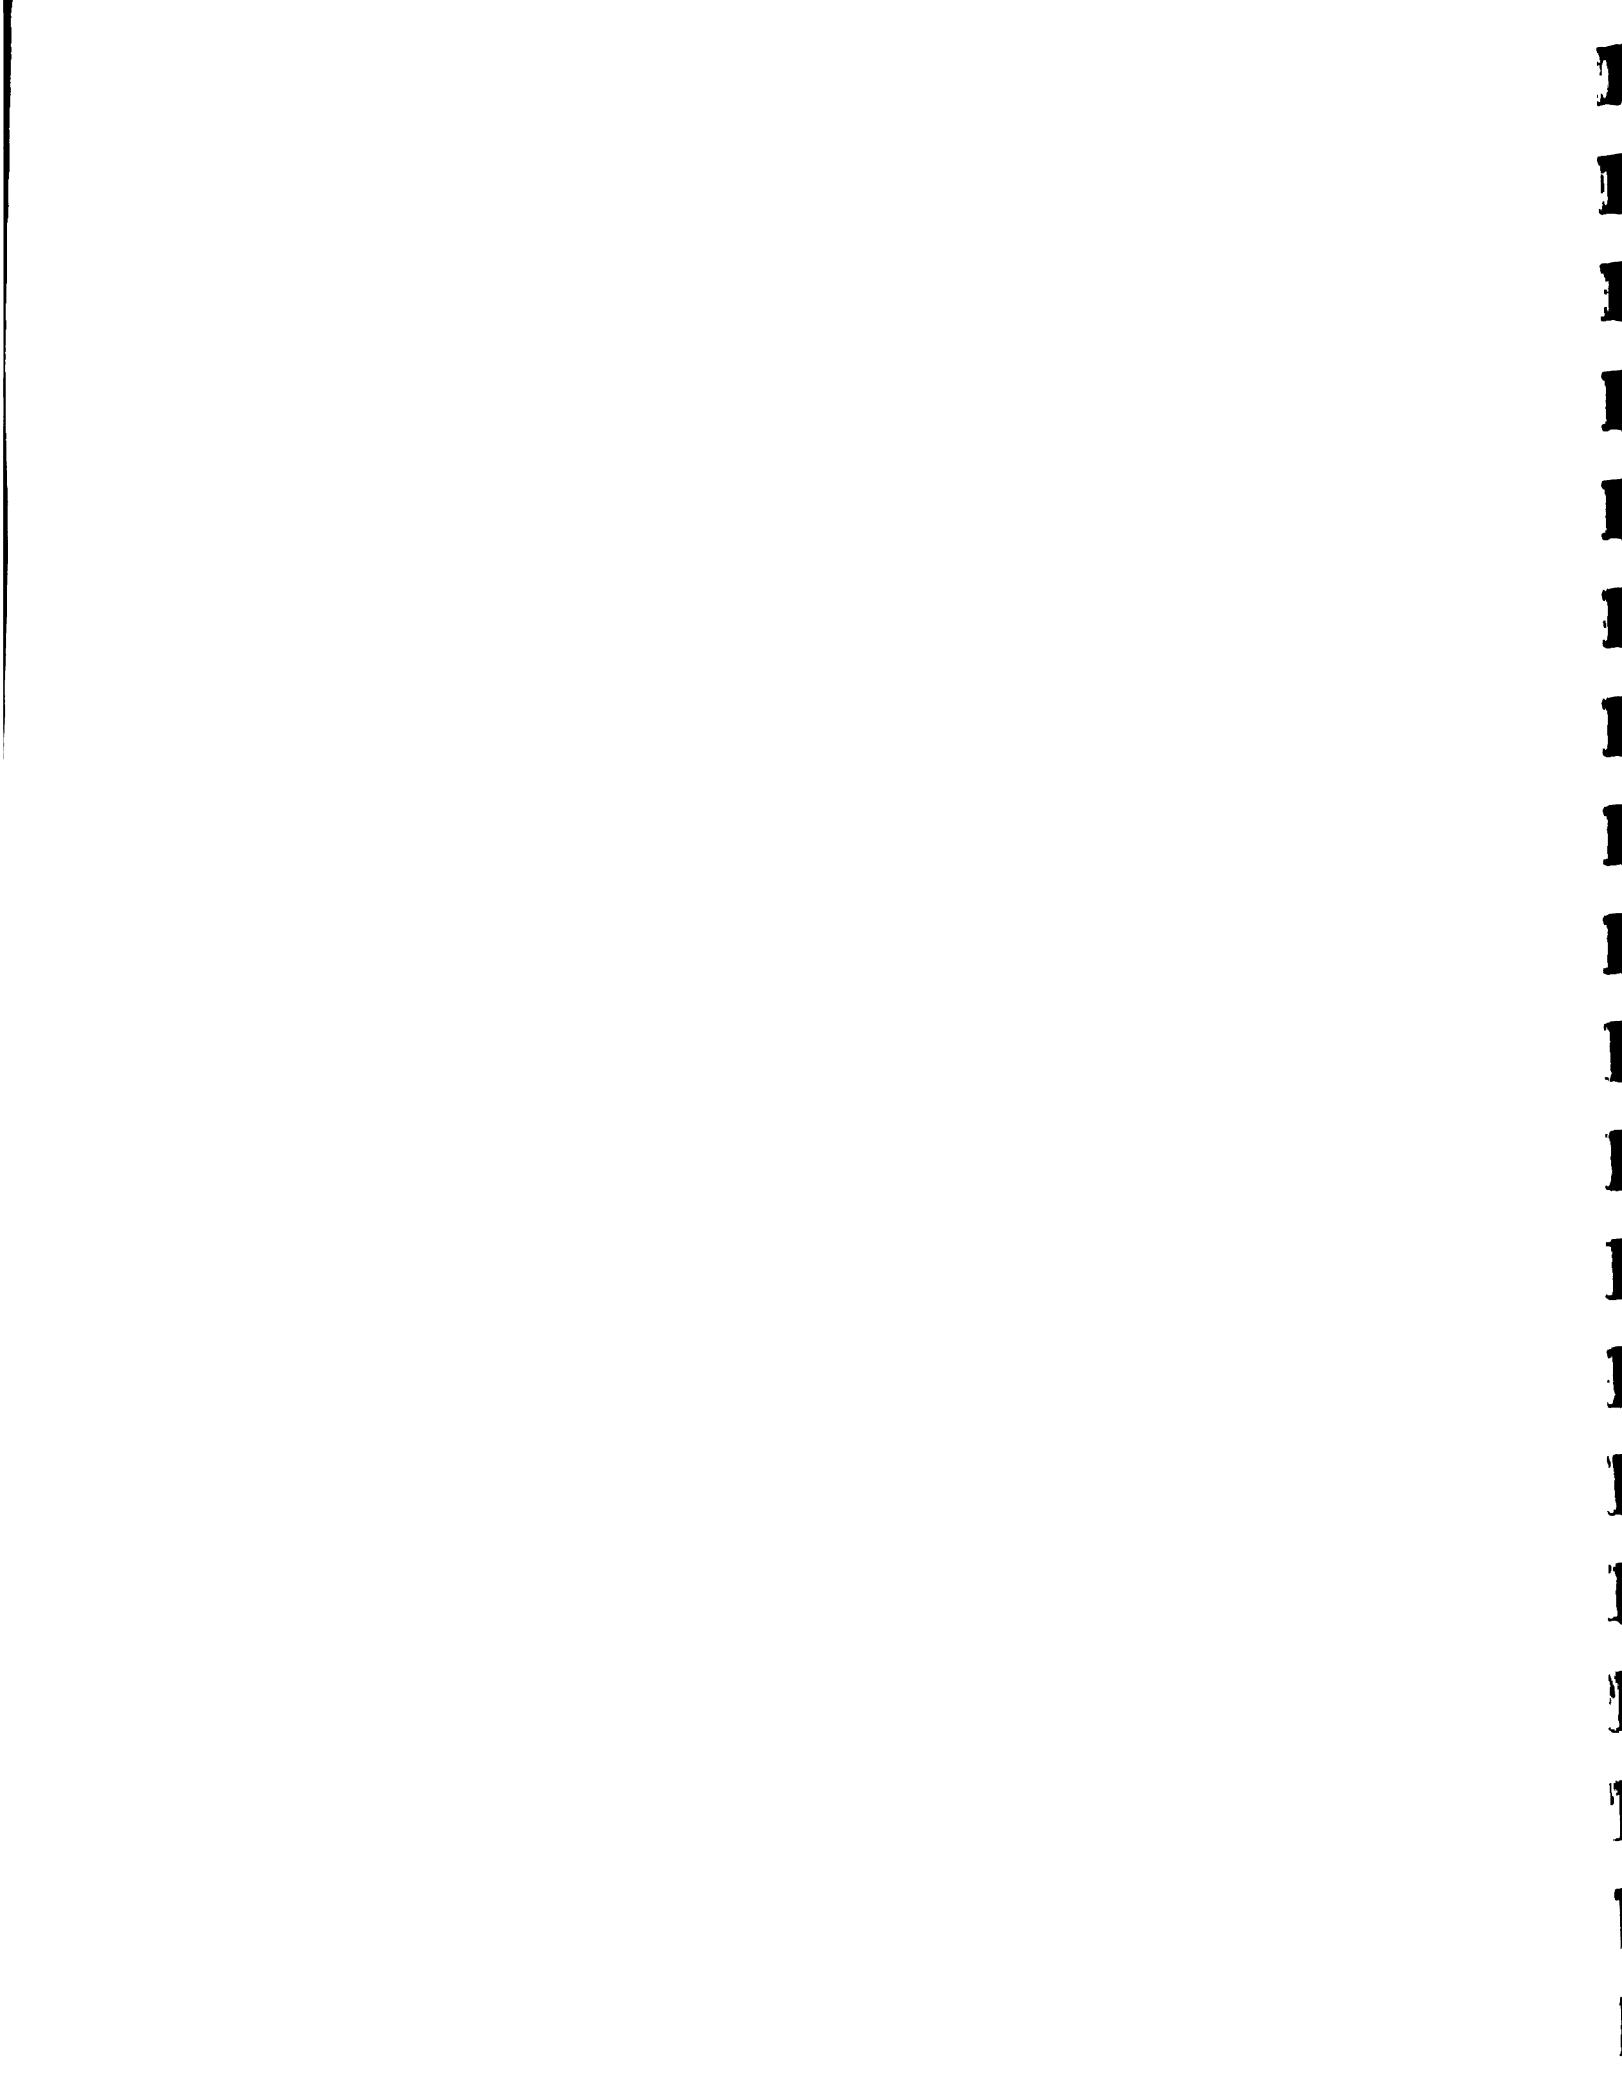

para una sección sólida en Acero A-36

$$F_b = 0.6 F_y = 0.6 (36.0) = \sim 22.0 \text{ ksc}$$

$$(\text{En Unid. Inglesas}) M = 1645 \times 2.2 \times \frac{3.28 \times 12}{1000} = 142.44 \text{ Kips-pulg} = 11.87 \text{ Kip-pie}$$

$$\text{Módulo de Sección Requerido, } S = \frac{M}{F_b} = \frac{142.44}{22} = 6.47 \text{ pulg}^3$$

Del Manual AISC: usar perfil W8x10 ($S = 7.81 \text{ pulg}^3$, $M = 16 \text{ Kip-pie}$) similar (ver det. estr.)

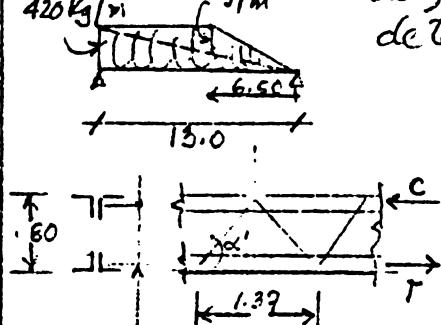

Cubierta Reticular

b) Tijerillas T_2 y T_3 Estas constituyen los elementos de la cubierta reticular designados como:
 ①, ②, ④, ⑤, ⑥, ⑦, ⑪, ⑫, y ⑯ (ver pag. 2)

los miembros centrales ④ y ⑬, localizadas en el Eje de Simetría de la Cubierta Reticular, no están sujetos a fuerzas axiales, como aparece en las figs. A-4 y A-8, por lo que se proponen dimensiones para la flexión causada por cargas verticales y/o de viento.

Miembros ④ y ⑬

Como el Estado de Carga $W_0 + L = 70 \text{ Kg/m}^2 > W_{\text{viento}} = 64 \text{ Kg/m}^2$
 $6.0 \times 70 = 420 \text{ Kg/m}$ (excluyendo la reducción de la succión por las cargas perpendiculares), puede adoptarse el esquema mostrado para determinar el régimen de flexiones.

$$\text{Tang} \alpha' = \frac{77}{6.85} = 1.124$$

$$\therefore \cos \alpha' = 0.6647$$

$$\text{Con } \frac{L}{t} = \frac{137}{6.617(2.54)} = 86, \text{ de la Tabla 3-36 del AISC, pag 5-74,}$$

$$f_a = 14.67 \text{ Ksc} = 1027 \text{ Kg/cm}^2 < f_a$$

El análisis se repite en el Cuadro B, usando el programa SPAT. En la pag B-5, aparece la compresión máxima en el miembro ⑬, del Cordón superior, con un valor de $C = 6772 \text{ Kg}$,

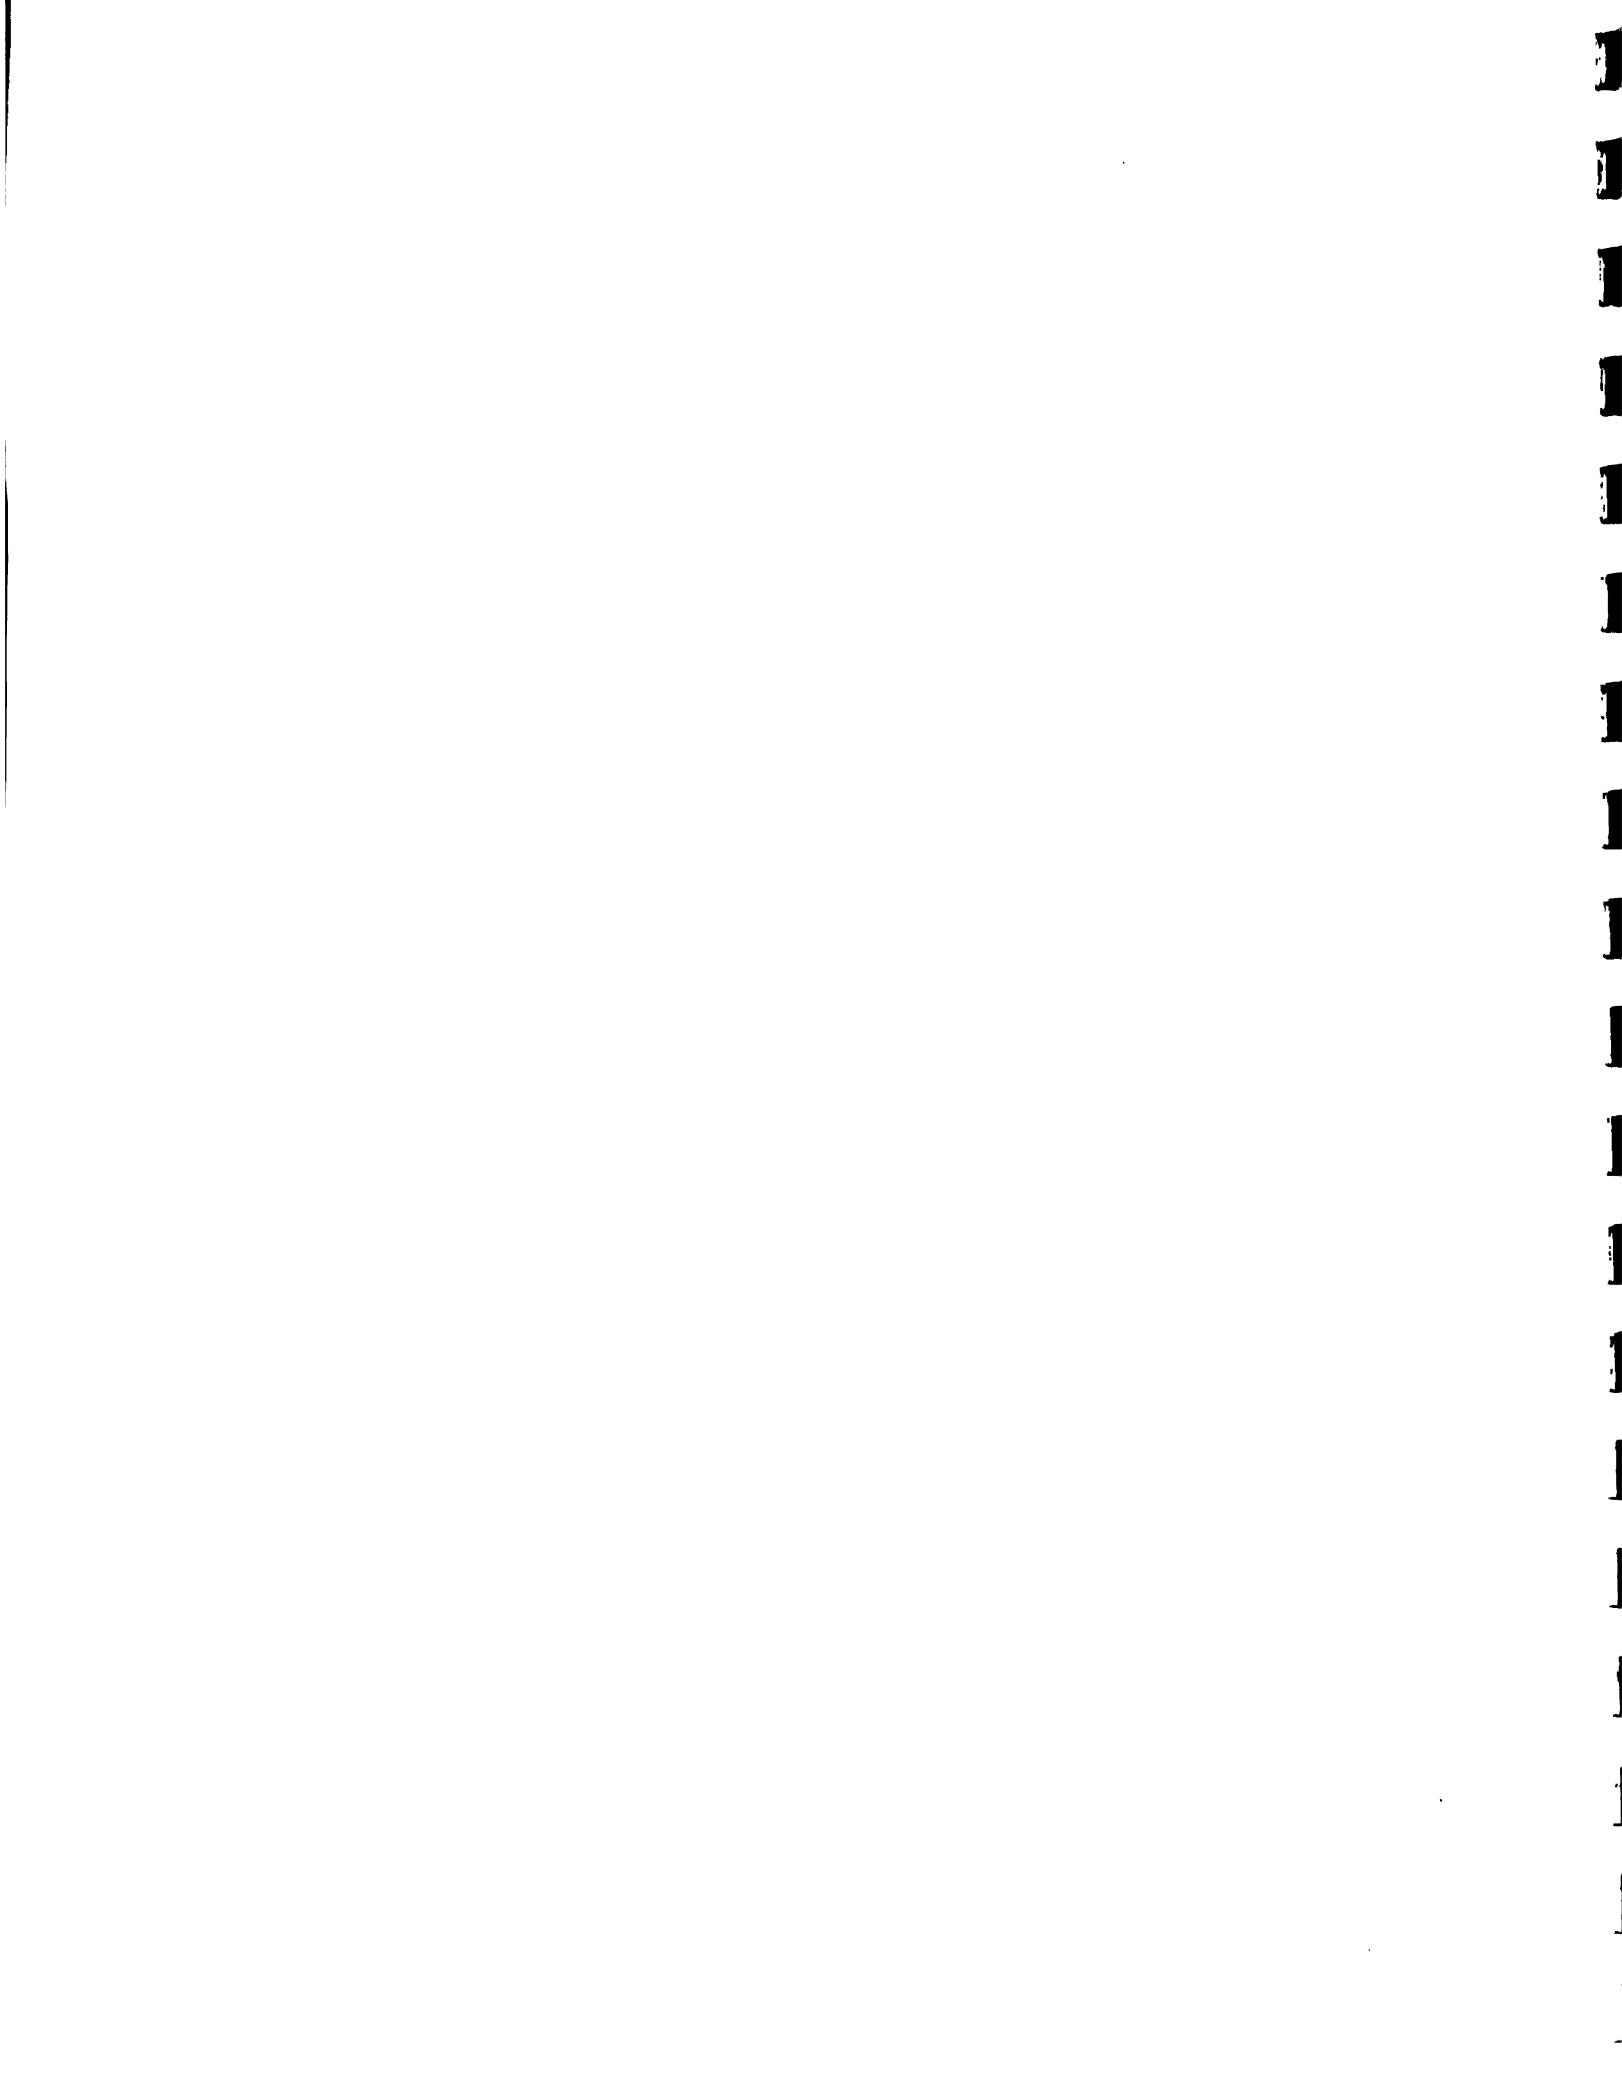

$$\therefore f_a = \frac{6772}{2(6.484)(2.54)^2} = 1084 \text{ Kg/cm}^2$$

$$\text{con } 2 \text{ ls de } 2'' \times 2'' \times 3/16 \quad f_a = \frac{6772}{2(7.15)(2.54)^2} = 734 \text{ Kg/cm}^2$$

$$\frac{L}{t} = \frac{137}{6.617(2.54)} = 87.4, \quad F_a = 14.50 \text{ Ksc} = 1015 \text{ Kg/cm}^2 > 734 \text{ Kg/cm}^2$$

El miembro ④ presenta una tracción de 9235 Kg ,

$$f_t = \frac{9235}{6772} (734) = 1001 \text{ Kg/cm}^2 < f_t = 0.6 f_a = 0.6 (36000) 0.07 = 1512 \text{ Kg/cm}^2$$

Cubierta Peticular

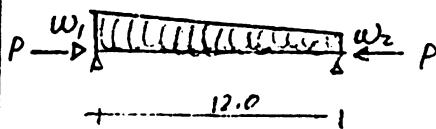

5/1

E/ ralor máximoo en diagonales es de 2469 Kg (mícmbrro ②),
con $1-2 \times 2 \times 1/8$ $\therefore f_a = \frac{2469}{489(2.54)^2} = 791 \text{ Kg/cm}^2$

$$\frac{L}{F} = \frac{103}{626(2.54)} = 65, \quad F_a = 16.94 \text{ KSI} = 11.86 \text{ Kg/cm}^2 > 791 \text{ Kg/cm}^2 \quad \text{o.k.}$$

usar $1-2 \times 2 \times 1/8$
en diagonales. ver det. tipografía T2

mícmbrros ⑤ y ⑥

Bajo la acción del viento

$$P = 4540 \text{ Kg} \quad (\text{ver pag. A-8})$$

$$W_1 \approx 20 \times (3.0 + 1.5) = 90 \text{ Kg/m}, \quad W_2 \approx 20 \times 1.0 = 20 \text{ Kg/m}$$

$$M = \frac{w_2 L^2}{8} + (W_1 - W_2) \frac{L^2}{2} (1.283) = \frac{20(18)^2}{8} + \frac{70}{2}(12).1283 = 1007 \text{ Kg-m}$$

para una sección con 4 Ls. $2 \times 2 \times 1/4$,

$$I = [6.695(2.54)^4]_2 + 2(1.88)(2.54)^2(\frac{77}{2})^2 = 36014 \text{ cm}^4$$

$$f = \frac{P}{A} \pm \frac{Mc}{I} = \frac{4540}{4(938)(2.54)} \pm \frac{1007 \times 100 \times 40}{36014} =$$

$$= 188 \pm 112$$

$$\text{En compresión, } 188 + 112 = 300 \text{ Kg/cm}^2$$

Dado el bajo esfuerzo de trabajo, se comprobará una sección menor: $2 \times 2 \times 1/8$

$$I = [3.38(2.54)^4]_2 + 2(1.96)(2.54)^2(\frac{77}{2})^2 = 18392 \text{ cm}^4$$

$$f = \frac{4540}{4(484)(2.54)^2} \pm \frac{1007 \times 100 \times 40}{18392} = 364 \pm 219$$

$$\text{En compresión, } f = 583 \text{ Kg/cm}^2$$

$$\text{Con } \frac{L}{r} = \frac{126}{626(2.54)} = 79.2, \quad F_a = 15.36 \text{ KSI} = 1075 \text{ Kg/cm}^2 > f_a$$

Estado D+L:

$$W_1 = 70(4.50) = 315 \text{ Kg/m}, \quad W_2 = 70 \text{ Kg/m}$$

$$M = \frac{70}{8}(12)^2 + (315 - 70) \frac{(12)^2}{2} (1.283) = 3523 \text{ Kg-m}$$

$$h_{\text{efectivo}} = 80 - 2(5.46)(2.54) = 77.23 \text{ cm-s}$$

$$C = T = \frac{M}{h_e} = \frac{3523}{77} = 4576 \text{ Kg}$$

$$f_a = \frac{4576}{2(484)(2.54)^2} = 783 \text{ Kg/cm}^2$$

$$\text{Con } \frac{L}{r} = \frac{126.3}{626(2.54)} = 79.3, \quad F_a = 15.47 \text{ KSI} = 1083 \text{ Kg/cm}^2 > f_a$$

usar $2-2 \times 2 \times 1/8$

en cordones Sup. e inf } ver det. {

usar $1-2 \times 2 \times 1/8$

Tipografía T3

Cubierta Péticular

Miembros (2) y (11)

para el Estado de Cargas verticales, en la pag. A-4, se presenta una tensión de 13765 Kg con 4 ls de $2'' \times 2'' \times 1/8''$.

$$f_a = \frac{13765}{4(1.44)(2.54)^2} = 1102 \text{ Kg/cm}^2 < F_c = 0.6 F_y = \\ = 0.6(36000) \cdot 0.7 = 1512 \text{ Kg/cm}^2$$

usar 4 ls $2'' \times 2'' \times 1/8''$ permitiendo
ver det. Estr de Tijerillas T5

c) Tensiones (miembros ⑨ y ⑩)

Estos elementos funcionan básicamente como arrastre horizontal para el caso de viento (no presentan fuerzas axiales para cargas vert.).

De la pag. A-8, la tracción es de 4623.4 Kg. para $1 \phi 3/4''$:

$$f_a = \frac{T}{A} = \frac{4623.4}{2.85} = 1622 \text{ Kg/cm}^2$$

De la secc. 1.5.6, del Manual AISC, (pag 5-26)

$$F_a = 0.6 F_y (1\frac{1}{2}) = 0.6(36000)0.07(1.333) = 2015 \text{ Kg/cm}^2 > f_a \text{ o.k.}$$

ver det.

d) Tijerillas T4

El análisis planar de estos elementos se detalla en el Anexo C, donde la máxima compresión en el cordón superior se presenta en el miembro ②, con un valor de 10,838 Kg. Combinando esta compresión con la componente de la acción conjunta, o espacial, se agrega una compresión de 19,266 Kg (miembro ③, pag A-4).

$$\text{Con } 2-3'' \times 3'' \times 1/4'' \quad f_c = \frac{10838}{2(1.44)(2.54)^2} + \frac{19266(1/2)}{2(1.44)(2.54)^2} = 1102 \text{ Kg/cm}^2$$

$$\text{para } \frac{L}{r} = \frac{182}{93(2.54)} = 77, \quad F_a = 15.69 \text{ Ksi} = 1098 \text{ Kg/cm}^2 \approx f_a \quad \text{o.k.}$$

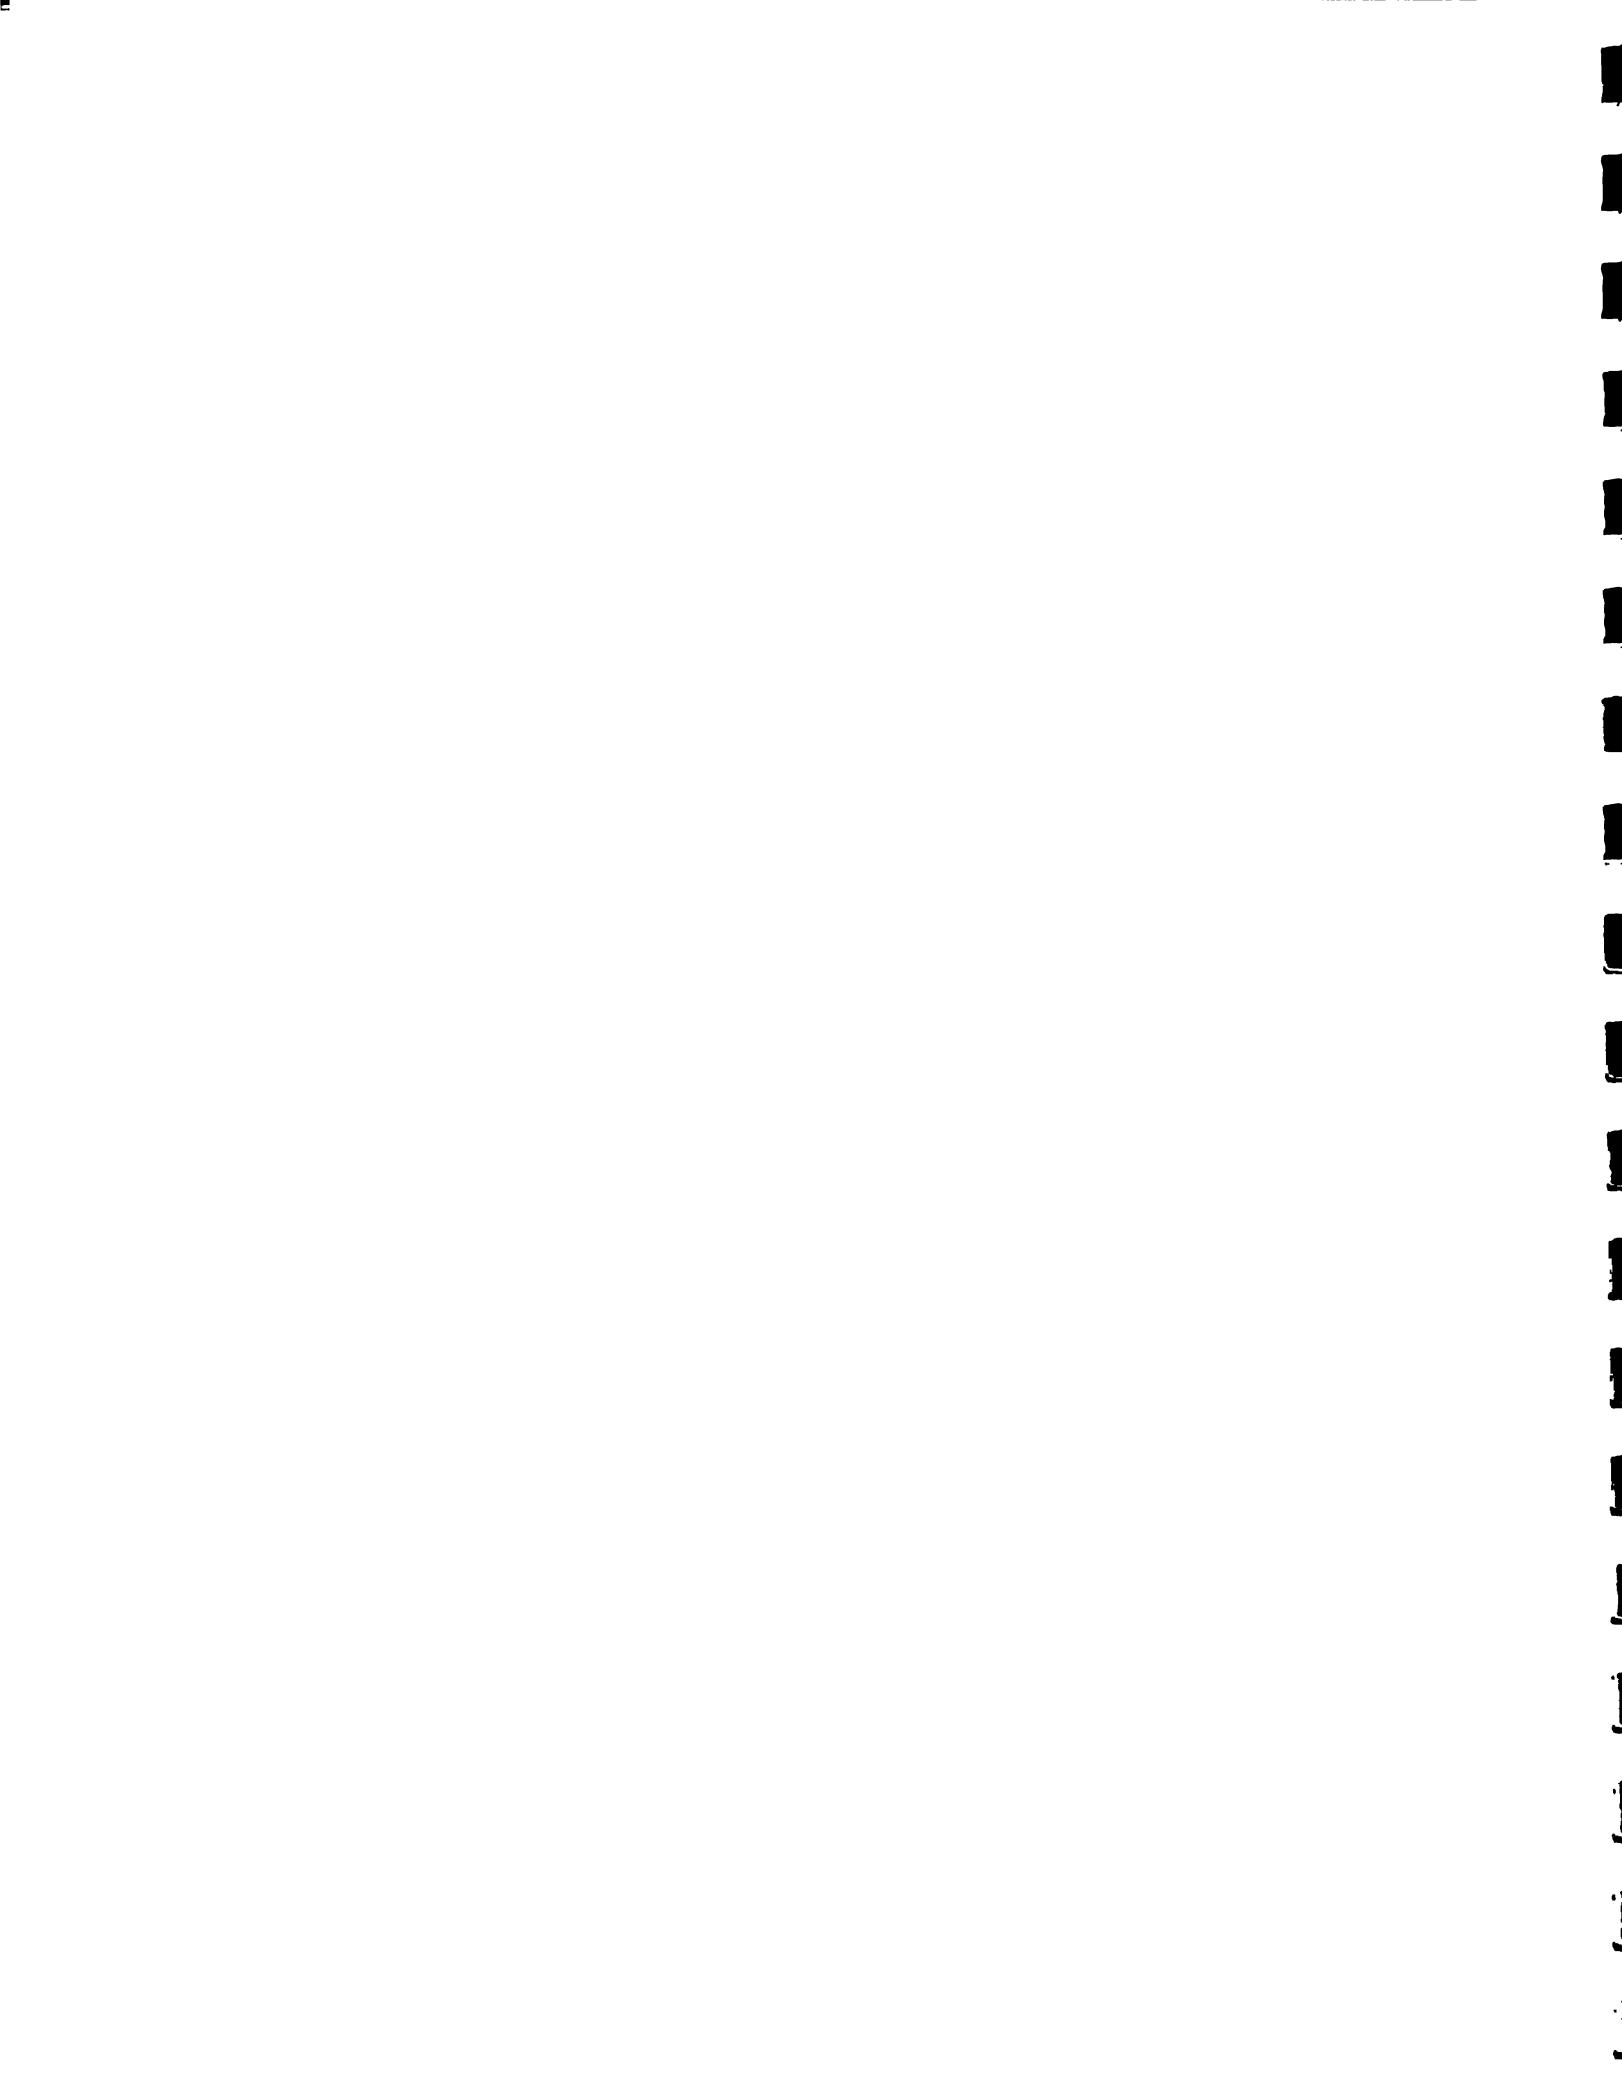

En el miembro ④ (pag c-6)

$$f_c = -\frac{15147}{2(1.44)(2.54)^2} + \frac{19266(1/2)}{2(1.44)(2.54)^2} = -297 \text{ Kg/cm}^2 \text{ (tracción)}$$

El valor máximo en diagonales es de 3542 Kg (miembro ③)

con $1-2'' \times 2'' \times 3/8''$

$$f_a = \frac{3542}{1.44} = 1185 \text{ Kg/cm}^2$$

Cubierta Reticular y Zonas Aneas

9/11

$$\frac{L}{r} = \frac{112}{0.626(2.5)} = 70.4, F_a = 16.38 \text{ Ksc} = 1147 \text{ Kg/cm}^2 > 1135 \text{ Kg/cm}^2$$

1.04 Comprobación de Reacciones

para el nudo Superior:

(pag. C-7)

$$\text{Tijerilla } T_4, \text{nudo } 2.4 = 1312 \text{ Kg}$$

(" B-7)

$$\text{ " } T_2, \text{ " " } = 975 \text{ "}$$

(" 5)

$$\text{ " } T_3 = \frac{70(12)}{2} + \frac{245(12)}{2} \cdot \frac{1}{3} = \frac{910}{3} \text{ "}$$

$$3197 \text{ Kg} < 4500 \text{ Kg}$$

O.K.

2.0 Cubiertas Metálicas en Zonas Aneas

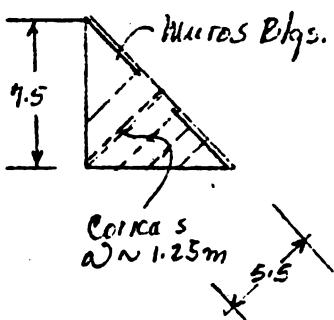

2.01 Cubiertas de Cubículos (comercios)

Siendo $w = 70 \text{ Kg/m}^2$ y $L = 5.00 \text{ m}$, las líneas principales de carga tendrán una flexión máxima de:

$$M = (w \cdot L') \frac{L'^2}{8} = (70 \cdot 6.0) \frac{(5)^2}{8} = 1313 \text{ Kg-m} < 1645 \text{ Kg-m}$$

(ver pag 3) usar perfil W8x10 o similar

2.02 Cubiertas en Entradas de Esquinas y en Margenes

En esta zona las propias correas "Z" serán prácticamente la estructura, como se muestra. Comprobación correas "Z":

para la cubierta central, con espaciamientos de 1.30 m y riegos de 6.00 m,

$$M = \frac{wL^2}{8} = \frac{70 \times 1.3}{8} (6)^2 = 410 \text{ Kg-m} = 35460 \text{ lb-pulg}$$

con perfiles Z de $8 \times 3 \times 1/16$,

$$I = \approx 8.4 \text{ pulg}^4, S \approx 2.1 \text{ pulg}^3$$

$$\therefore f_a = \frac{M}{S} = \frac{35460}{2.1} = 16885 \text{ lb/pulg}^2$$

$$< 0.6 F_y = 0.6(36000) \approx 22000 \text{ lb/pulg}^2$$

En la margen superior, teniendo un riego de $L = 4.50 \text{ m}$, se usará igualmente las correas "Z" como estructura básica. ver det.

3.0 Uniones de las Estructuras Metálicas

3.01 Diagonales soldadas (tijerillas T4)

Con una tracción y/o compresión máxima de $3592 \text{ Fps} \approx 7800 \text{ lbs}$.

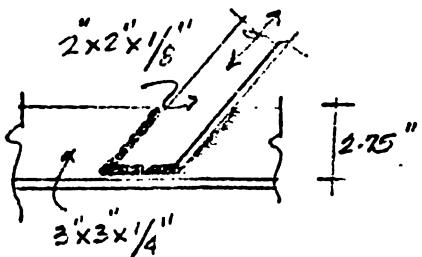

para soldadura de $1/8"$, y un material base A36, la resistencia admisible de la soldadura sería de

(AISC-Sec. 1.17.3(1))

$$S = \frac{1}{9} (0.707) D \cdot 6 \times 36.0 \approx 1.91 \text{ Kips por pulg. de long.}$$

solo bordos de soldadura

La longitud requerida de soldadura de $\frac{1}{8}$ " sería de:

$$L = \frac{7.80}{1.91} = 4.08 \text{ pulg}$$

para un angulo aprox. de 45° , la longitud deseable (como muestra la fig.) sería de:

$$\frac{2(2.75)}{0.707} + \frac{2.0}{0.707} = 10.6 \text{ pulg} > 4.08 \text{ pulg} \quad \text{o.k.}$$

3.02 Uniones Entre Tijerillas

- En los apoyos de la cubierta reticulada, las tijerillas serán soldadas entre sí y empotradas en hormigón armado, prolongando las columnas de este material. (ver det.)
- En las uniones superiores debe generarse una capacidad mínima de 14729 Kgs (ver pag C-7, Nudo 24), con lo que la longitud requerida de soldadura $\frac{3}{16}$ " sería de:

$$\frac{\frac{14729}{1000}}{\frac{3}{16}(.707)0.6 \times 36.0} = 11 \text{ pulg}$$

Con esta dimensión mínima se proporcionan las placas superiores de unión. ver det.

4.0 Estructuras en Hormigón Armado

4.01 Rígas Ductiles

a) Rígas V₁:

$$\text{peso muerto de Blgs} = .2 \times 2.0 \times 1800 \times 1.4 = 1008 \text{ Kg/m}$$

$$\text{" prepicio ríga } = .2 \times .6 \times 2400 \times 1.4 = \frac{403}{1451} \text{ "}$$

$$M_a = \frac{wl^2}{8} = \frac{1451(8)^2}{8} = 11605 \text{ Kg-m}$$

para $f'_c = 180 \text{ Kg/cm}^2$, $f_y = 2800 \text{ Kg/cm}^2$, $b = 20 \text{ cm}$, $d = 55 \text{ cm}$, $g = 0.13$

$$M_a = \varphi [6d^2f'_c (1 - 0.59g)] =$$

$$= .9 [2(55)^2 180 \times .13 (1 - 0.59 \times .13)] = 11764 \text{ Kg-m} > M$$

$$P = \varphi \frac{f'_c}{f_y}$$

$$A_s = 0.13 \frac{180}{2800} (20)55 = 9.19 \text{ cm}^2$$

usar $2\phi 1"$ sup. e inf.

$$\text{Cortante: } V_{max} = 1451 \left(\frac{7.8}{2} - .6\right) = 4789 \text{ Kg}$$

$$\varphi D_c = .85(0.3)\sqrt{180} (20)55 = 6649 \text{ Kg} > V$$

h) Tetas V₂

$$\text{Peso muros de bloques} = .20 \times 1.5 \times 1800 \times 1.4 = 756 \text{ Kg/m}$$

$$\text{" proprio} = .2 \times .2 \times 2400 \times 1.4 = \frac{134}{890} "$$

$$-M_{\text{max}} \approx \frac{wL^2}{10} = \frac{890}{10} \left(\frac{3.3 + 2.8}{2} \right)^2 = 828 \text{ Kg-m}$$

con $b = 20 \text{ cm}, d = 15 \text{ cm}$ y $\gamma = 0.13$, $M_u = 875 \text{ Kg-m} > -M_{\text{max}}$

$$-A_s = 0.13 \frac{180}{2800} (20) 15 = 2.51 \text{ cm}^2$$

usar $2\phi \frac{1}{2}$ sup. e inf.
ver det.

c) Tetas V₃

con radios iguales a los de la V₂, menores cargas, y una sección de 0.20×0.50 , esta rígida

4.02 Columnas C₁

Bajo la acción del viento, las columnas que sostienen perimetralmente a la cubierta central, tienen solicitudes por cargas horizontales que totalizan aprox. en Estado Ult. (ver pag. 3 y A-9) $2(1525 + 713)1.3 = 5819 \text{ Kg}$

para 5 columnas, y con una alt. de rectangulos de 0.80 m ,

$$M_{\text{col}} = \frac{5819 \times 0.8}{5} = 466 \text{ Kg-m}$$

(notese que esta flexión es inferior que 828 Kg-m , en las rígidas V₂) para una sección de $0.20 \times 0.20 \text{ m}$ y $4\phi \frac{3}{4}$, $M_u > 466 \text{ Kg-m}$.

En el caso de cargas verticales, para las cols. de esquina se tendría aprox.

$$(\text{ver pag. 1}) P = \text{Área} \times w_u = 12 \times 14 (20 \times 1.4 + 50 \times 1.7) = 18984 \text{ Kg}$$

$$\text{con } 4\phi \frac{3}{4}, \rho = \frac{4 \times 2.84}{400} = 0.0284,$$

$$P_u = 0.8 \varphi A_g [0.85 f'_c (1-\rho) + \rho f_y] =$$

$$= 0.8 \times 0.7 \times 400 [0.85 \times 180 (1 - 0.0284) + 0.0284 \times 2800] =$$

$$= 51,111 \text{ Kg} > 18984 \text{ Kg.}$$

$$\frac{l_n}{r} = \frac{3.0}{0.3(0.2)} = 50 < 64 \quad \text{no requiere reducción por esbeltez}$$

4.03 Columnas C₂

Con 4 Ø 1½" y una sección de 0.20 x 0.20,

$$P_u = 0.8 \times 7 \times 400 [0.85 \times 180 (1 - 0.0129) + 0.0129 \times 2800] =$$

$$= 41921 \text{ Kg} > 18984 \text{ Kg.}$$

o.k.

ver det.

5.0 Zapatas

Dado el bajo régimen de cargas verticales, para las zapatas de los columnas principales podrían usarse las fundaciones de los muros de bloques, según se indica en las notas constructivas de tales estructuras.

Comprobación Esf. en el terreno:

De la pag. 9,

$$\begin{aligned} \text{Reacción Cols C}_1 &= 12.0 \times 14.0 \times 70 = 11760 \text{ Kg} \\ \text{peso propio Cols} &= 2 \times 2 \times 3.0 \times 2400 = \underline{\underline{288}} \\ &\quad 12048 \text{ Kg} \end{aligned}$$

Con un esf. adm. para las fundaciones de 2.5 Kg/cut,

$$\text{Área necesaria en planta} = \frac{P}{\sigma} = \frac{1.1 \times 12048}{25000} = 0.53 \text{ m}^2$$

Como zapata continua se protege con área mínima de
 $3.00 \times 0.5 = 1.50 \text{ m}^2 > 0.53 \text{ m}^2$

6.0 Uniones Entre la Estructura Metálica y las Col.s. de H.A.

o.k.

Con placas de asiento de 7x7 pulg. ($17.78 \times 17.78 \text{ cm}^2$), la carga límite permitida por el ACI-318-83 (secc. 10.15) sería

$$\begin{aligned} \phi(0.85 f'_c A_1) &= 0.7 (0.85 \times 180 \times 17.78 \times 17.78) = \\ &= 33858 \text{ Kg} > 18984 \text{ Kg} \text{ (ver pag. 9)} \end{aligned}$$

7.0 Observaciones Sobre Análisis, Diseño y Construcción

- No se consideró necesario realizar los miembros de la columna principal para las dimensiones seleccionadas fundamentalmente, dadas las condiciones conservadoras adoptadas inicialmente y el bajo régimen de deflexiones obtenido.
- Para la construcción de la zona central del mercado, y seguramente las piezas de acero disponibles en el comercio local, podría exigirse al contratista que confeccione las tirillas con contraflechas razonables, de aprox. 1/3 de las de flexiones solicitadas en los Anexos A, B y C.

Anexo C: Triángulos T₄

La nomenclatura de miembros y cargas igual a la de los Triángulos T₂
(ver anexo B)

$$\tan \alpha'' = \frac{4.25}{17.69} = .2402$$

$$\sin \alpha'' = .2336$$

$$\cos \alpha'' =$$

Cargas seleccionadas para el análisis de los miembros

Cordones Sup. e inf., 2 Ls - 3x3x1/4": $2(1.49)(2.54)^2 = 18.58 \text{ cm}^2$

Diagonales, triangular de 2x2x3/16": $(715)(2.54)^2 = 9.61 \text{ cm}^2$

Calculo de Cargas

$$P_1 = \left(\frac{7.0 + 7.5}{2}\right) 0.5 \times 70 = 237 \text{ Kg}$$

$$P_2 = 237 + \left(\frac{6.5 \times 1.2}{2} + \frac{6.0 \times 1.3}{2}\right) 70 = 510 \text{ Kg}$$

$$P_3 = \frac{1}{2} \left(5.2 \frac{6.0}{6.5} 1.3 + 4.8 \frac{6.5}{6} \right) 70 = 428 \text{ Kg}$$

$$P_4 = 3.6 \left(\frac{6.5}{6.0}\right) 1.2 \times 70 = 328 \text{ Kg}$$

$$P_5 = 2.4 \left(\frac{6.5}{6.0}\right) 1.2 \times 70 = 219 \text{ Kg}$$

$$P_6 = \quad \quad \quad = 109 \text{ Kg}$$

Reacción de las pujas T₁ } $P_7 = 210 \times \frac{6.5}{2} + 210 \times \frac{6.5}{2} \times \frac{1}{3}$
 $\quad \quad \quad + 210 \times \frac{6}{2} + 70 \times 3.25 = 1768 \text{ Kg}$

$$P_8 = 437 \text{ Kg}$$

$$P_9 = 328 \text{ Kg}$$

$$P_{10} = 219 \text{ Kg}$$

$$P_{11} = 109 \text{ Kg}$$

iguales a las correspondientes en T₂

NODE COORDINATES - EACH GROUP COVERS FROM NODE (NFR) TO NODE (NTO), WITH TYP. INCREMENT (NDEL), DESCRIBING:

| NFR | NTO | NDEL | NUMNO | X OF (NFR) | Y OF (NFR) | Z OF (NFR) | TYP. | ΔX | TYP. | ΔY | TYP. | ΔZ | (NUMNO) | NODES |
|-----|-----|------|-------|------------|------------|------------|------|------------|------|------------|------|------------|---------|-------|
| 1 | 1 | 0 | 0 | 1 | -1.414 | 0 | 0 | 0.423 | 0 | 0 | 0 | 0 | 0 | 0 |
| 3 | 23 | 2 | 11 | 0 | 0 | 0 | 0 | 0.763 | 1 | 0.769 | 0 | 0 | 0 | 425 |
| 2 | 2 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 4 | 22 | 2 | 10 | 1 | 0.56 | 0 | 0 | 0.254 | 1 | 0.769 | 0 | 0 | 0 | 425 |
| 24 | 29 | 0 | 1 | 17.69 | 0 | 0 | 4 | 0.25 | 0 | 0 | 0 | 0 | 0 | 0 |

ELEMENT AREAS - EACH GROUP COVERS FROM ELEMENT (NFR) TO ELEMENT (NTO) WITH TYP. NUMBER INCREMENT (NDEL)

| NFR | NTO | NDEL | NUMEL | IFR | JFR | KDEL | AREA |
|-----|-----|------|-------|-----|-----|-----------|----------|
| 1 | 1 | 0 | 1 | 1 | 1 | 2 | 0.000461 |
| 2 | 42 | 4 | 11 | 1 | 3 | 20.001858 | |
| 3 | 3 | 10 | 1 | 2 | 3 | 0.001858 | |
| 4 | 44 | 4 | 11 | 2 | 4 | 20.001858 | |
| 5 | 43 | 2 | 20 | 3 | 4 | 1.000461 | |
| 46 | 45 | 0 | 1 | 23 | 24 | 0.000461 | |

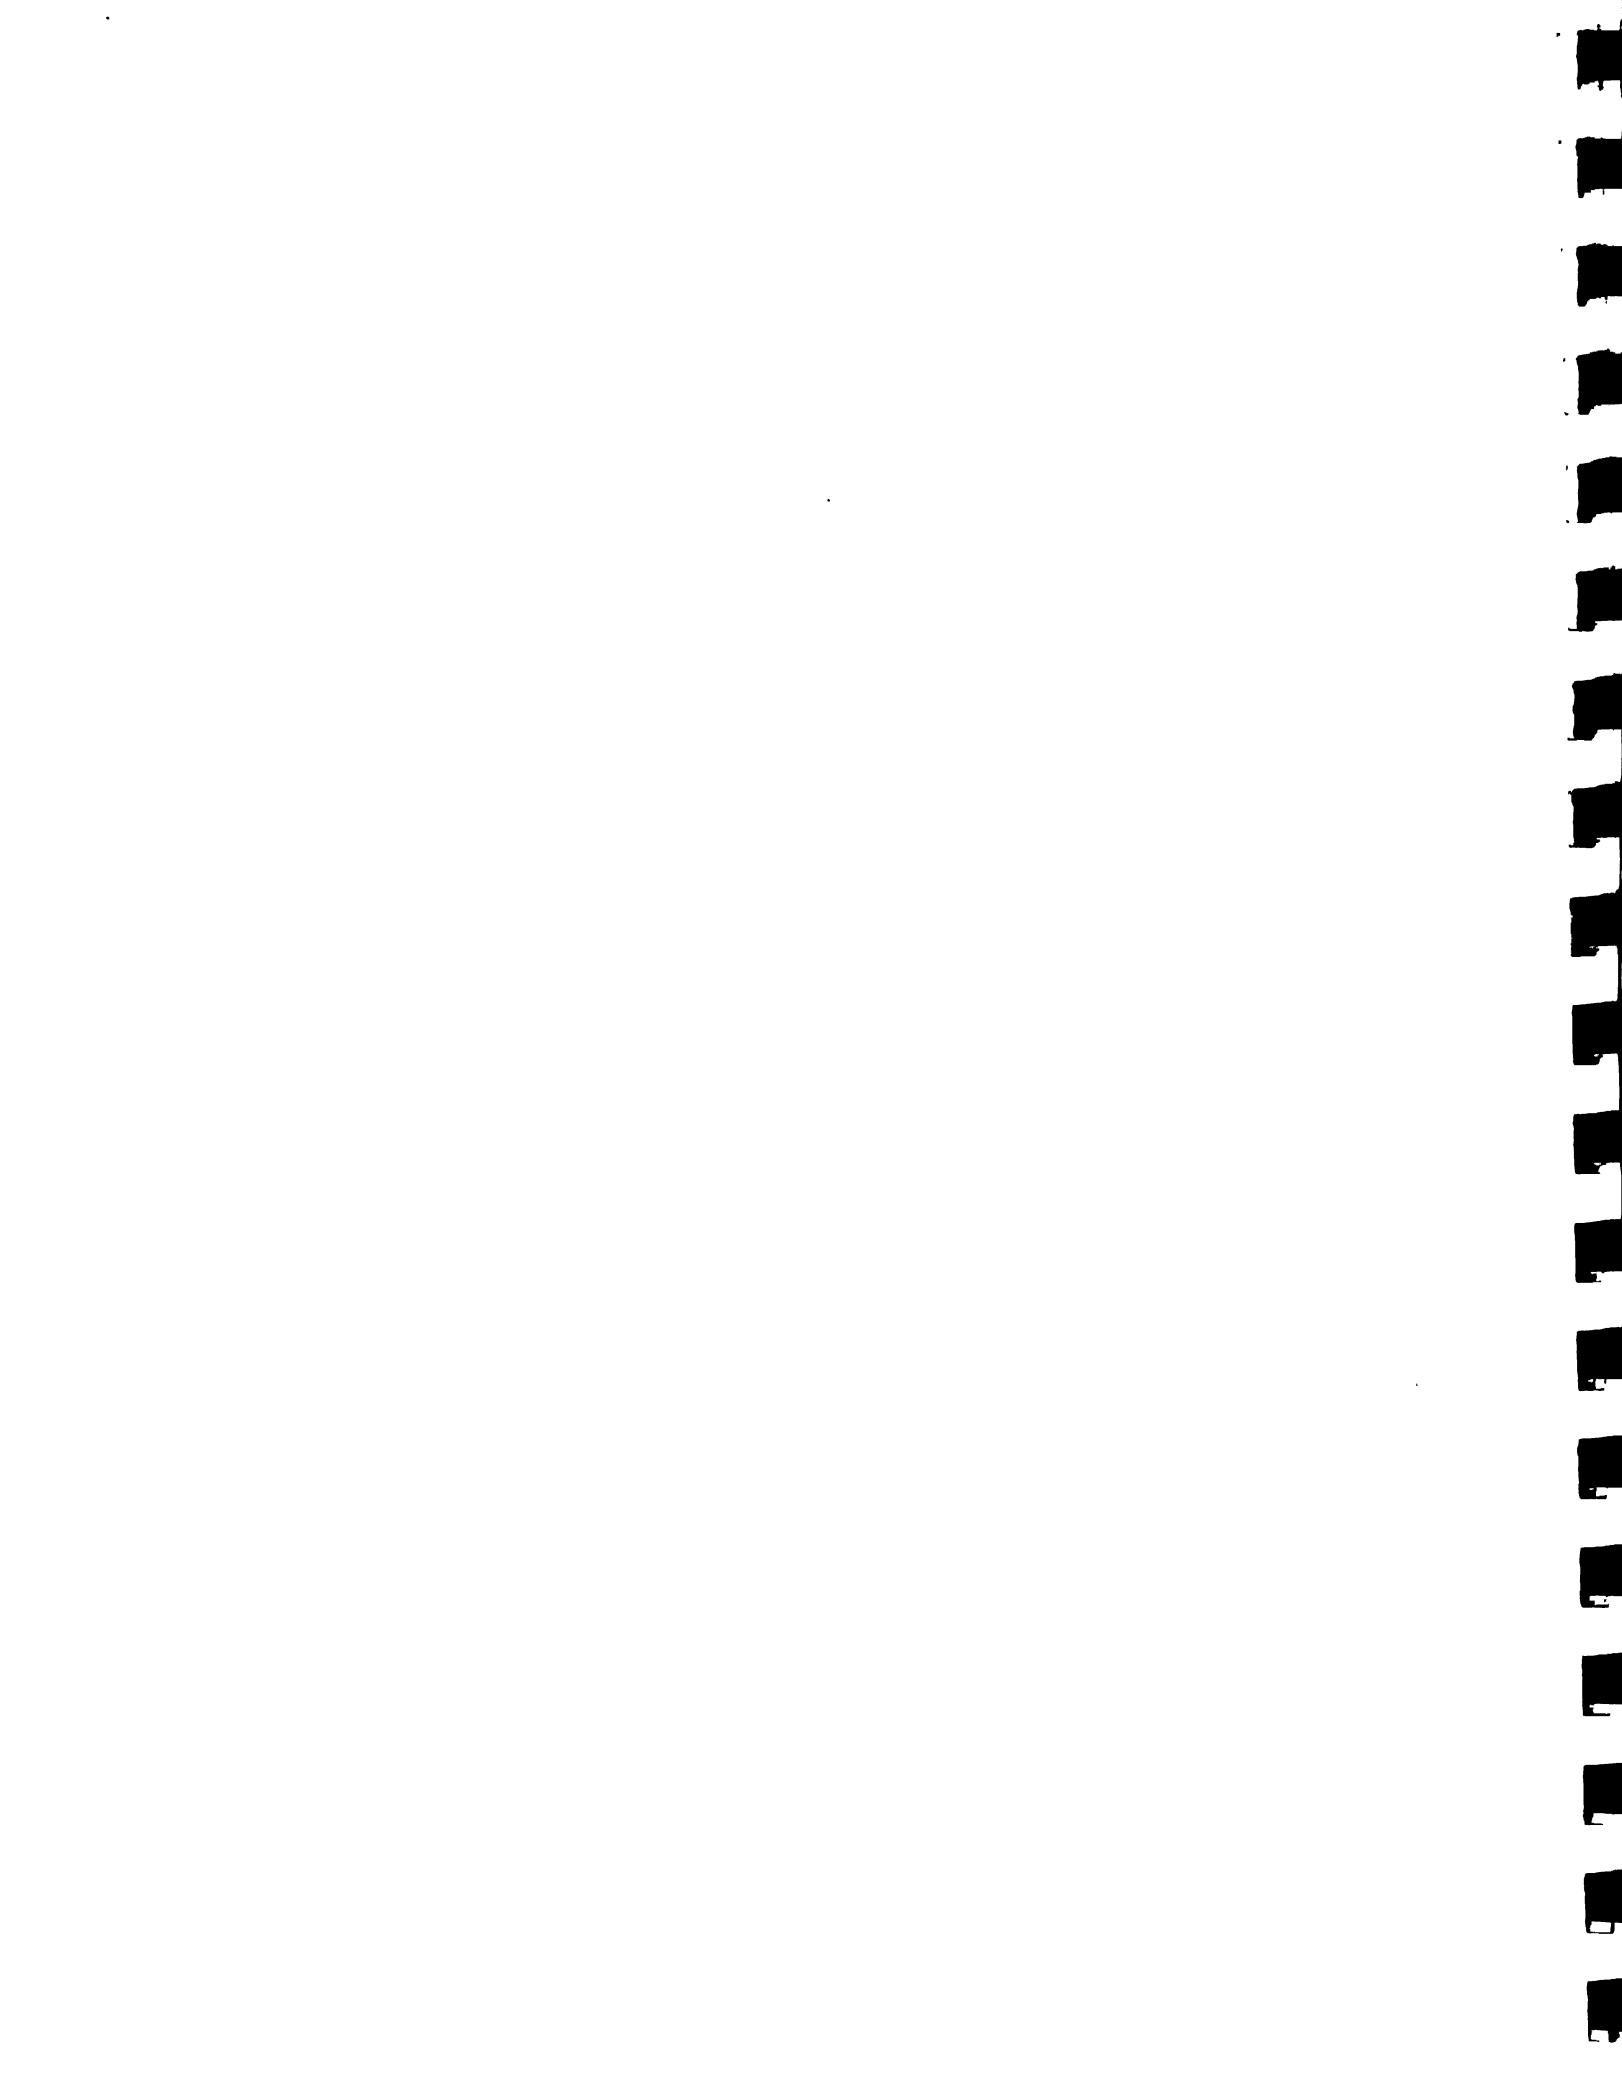

APPLIED LOADS, IN FX, FY, FZ SEQUENCE - EACH LOAD ACTS ON GROUP OF NODES STARTING AT (NFR) AND ENDING AT (NTO), WITH TYP. NO. INCREMENT (NDEL)

| NFR | NTC | NDEL | FORCE | NTO | NDEL | FORCE |
|-----|-----|------|--------|-----|------|----------|
| 1 | 1 | 0 | -6.237 | 13 | 0 | -1.768 |
| 3 | 3 | 0 | -0.510 | 15 | 15 | 0 -0.437 |
| 5 | 5 | 0 | -0.428 | 17 | 17 | 0 -0.328 |
| 7 | 7 | 0 | -0.328 | 19 | 19 | 0 -0.219 |
| 9 | 9 | 0 | -0.219 | 21 | 21 | 0 -0.109 |
| 11 | 11 | 0 | -0.109 | | | |

DESCRIPTION OF SUPPORTS - EACH NODE HAS 3 ENTRIES TO COVER DIRECTIONS X, Y, Z
WRITE 1 FOR DISPLACEMENT RESTRICTION, ZERO OTHERWISE

| NODE | KX | KY | KZ |
|------|----|----|----|
| 2 | 1 | 1 | 1 |
| 23 | 1 | 1 | 0 |
| 29 | 1 | 1 | 1 |
| 1 | 0 | 1 | 0 |

C-2
Los nodos restantes se declaran igualmente con "desplazamiento restringido" en la dirección X (ver "echo print")
