**RECOMMENDATIONS FOR LAND USE AND IRRIGATION
NEEDS IN THE BRUMDEC PROJECT**

by

**Humberto Pizarro
Irrigation & Drainage Specialist
IICA/Jamaica**

1. Introduction

This report is prepared in response to the request made by Dr. Johnson Masterton at the meeting held between BRUMDEC officials and the IICA Consultants on July 1, 1981, in the office of the Administrative Manager of BRUMDEC.

IICA is required to supply to BRUMDEC a brief report on the following aspects of land use and irrigation requirements:-

- (i) the type of crops which could be grown in the Project area without supplementary irrigation, specifying locations
- (ii) the type of crops which could be grown in the Project area with supplementary irrigation, the volume of supplementary irrigation required, and how such irrigation could be supplied at the least cost.

In this report it is assumed that the estimates of effective rainfall (defined as that part of total annual and seasonal rainfall that is available for crop production), exhibited in Appendix I, based on data from the Santa Cruz Station is valid for the BRUMDEC Project area. The recommendations and conclusions in this report are based on comparisons of the estimates of actual evapotranspiration and the estimates of effective rainfall which provide estimates of soil moisture deficit on a monthly basis.

$\Gamma = \delta_0 + \frac{1}{2} \ln \left(\frac{\rho + \sqrt{\rho^2 - 4\delta_0}}{2} \right)$

the first time, I am not so good at it, but
I think I have done a good job. I
will continue to work hard and practice,
and I am sure I will get better over time.

A topographical survey of the Project area would provide data that could be used to refine the estimates but the time period set for the provision of this report does not permit for such a survey to be arranged.

2. Crops which may be grown in the Project area without supplementary irrigation

Estimates of actual evapotranspiration of effective rainfall, and of soil moisture deficits are given for several crops in Appendix II. The crops listed hereunder can be grown in the Project area without supplementary irrigation. The growing period is also defined.

(a) On Peat Soil

<u>Crop</u>	<u>Growth Period</u>
Carrot	April - June; September - November
Corn	August - November
Cabbage	September - November
Watermelon	September - November
Onion (green)	April - May; September - October
Onion (bulb)	April - June; September - November

(b) On Mineral Soil

<u>Crop</u>	<u>Growth Period</u>
Corn	August - November
Sorghum	March - June; August - November

3. Crops which may be grown in the Project area with supplementary irrigation to supply the moisture deficit

(a) On Peat Soil

<u>Crop</u>	<u>Growth Period</u>	<u>Moisture Deficit</u>	
		<u>Period</u>	<u>Amount (mm)</u>
Tomato	September - November	November	65
Tomato	April - June	June	154
Lettuce	September - November	November	60
Beans	November - January	December-January	230
Corn	March - June	June	28

and the corresponding values for the first three EOFs are shown in Fig. 10. The first EOF is dominant, explaining 30% of the variance, and the second and third EOFs explain 15% and 10% of the variance, respectively.

The EOFs of the monthly mean precipitation anomalies are shown in Fig. 11. The first EOF is dominant, explaining 30% of the variance, and the second and third EOFs explain 15% and 10% of the variance, respectively. The first EOF is associated with the seasonal cycle of precipitation, showing a minimum in winter and a maximum in summer. The second EOF is associated with the meridional gradient of precipitation, showing a maximum in the subtropics and a minimum in the midlatitudes. The third EOF is associated with the meridional gradient of precipitation, showing a maximum in the midlatitudes and a minimum in the subtropics.

3) The effect of the atmospheric circulation on the seasonal cycle of precipitation

The seasonal cycle of precipitation is determined by the atmospheric circulation. The atmospheric circulation is influenced by the seasonal cycle of the solar radiation, the seasonal cycle of the Earth's orbit, and the seasonal cycle of the Earth's rotation. The seasonal cycle of the atmospheric circulation is influenced by the seasonal cycle of the solar radiation, the seasonal cycle of the Earth's orbit, and the seasonal cycle of the Earth's rotation. The seasonal cycle of the atmospheric circulation is influenced by the seasonal cycle of the solar radiation, the seasonal cycle of the Earth's orbit, and the seasonal cycle of the Earth's rotation.

The seasonal cycle of the atmospheric circulation is influenced by the seasonal cycle of the solar radiation, the seasonal cycle of the Earth's orbit, and the seasonal cycle of the Earth's rotation. The seasonal cycle of the atmospheric circulation is influenced by the seasonal cycle of the solar radiation, the seasonal cycle of the Earth's orbit, and the seasonal cycle of the Earth's rotation.

The seasonal cycle of the atmospheric circulation is influenced by the seasonal cycle of the solar radiation, the seasonal cycle of the Earth's orbit, and the seasonal cycle of the Earth's rotation. The seasonal cycle of the atmospheric circulation is influenced by the seasonal cycle of the solar radiation, the seasonal cycle of the Earth's orbit, and the seasonal cycle of the Earth's rotation.

4) The effect of the atmospheric circulation on the seasonal cycle of precipitation

The seasonal cycle of precipitation is determined by the atmospheric circulation. The atmospheric circulation is influenced by the seasonal cycle of the solar radiation, the seasonal cycle of the Earth's orbit, and the seasonal cycle of the Earth's rotation. The seasonal cycle of the atmospheric circulation is influenced by the seasonal cycle of the solar radiation, the seasonal cycle of the Earth's orbit, and the seasonal cycle of the Earth's rotation.

<u>Crop</u>	<u>Growth Period</u>	<u>Moisture Deficit</u>	
		<u>Period</u>	<u>Amount (mm)</u>
Watermelon	April - June	June	36
Pigeon Pea (local)	January - December	(February (June - July	2.25 186
Rice	March - June	March - April	272
Rice	September - December	November-December	292

(b) On Mineral Soil

<u>Crop</u>	<u>Growth Period</u>	<u>Moisture Deficit</u>	
		<u>Period</u>	<u>Amount (mm)</u>
Corn	March - June	June	28
Peanut	March - June	June	20
Sweet Potato	March - June	April	24
		June	109
Sweet Potato	September-December	November-December	177
Pigeon Peas (local)	January-December	(February (June-July	2.25 186
Sugar Cane	January-December	(January-April (June-September (November-December	394 418 227
Rice	March - June	March - April	272
Rice	September-December	November-December	292

4. Probability of less than average rainfall occurring

Using the Table C1 of the GRONTMIJ Report ⁽¹⁾ a rough estimate of the probability range within which falls the probability of less than average rainfall occurring has been extracted and is presented in Appendix I. Except for three (3) months of the year - January, April, and October, the probability of less than average rainfall occurring falls between P=0.5 and P=0.75. In Jamaica the probability of less than average rainfall occurring falls between P=0.75 and P=0.90. In April and October the probability of less than average rainfall occurring falls between P=0.25 and P=0.50.

5. Surface water resources

A map showing the Black River Upper Morass Surface Water Resources is attached as Appendix III of this report.

6. Conclusion

According to the objective of this study we have arrived at the following conclusions:

- (i) It is possible to cultivate the BRUMDEC lands without having to follow the irrigation scheme proposed by the Consultant (Harza et al).
- (ii) The 0.75 frequency monthly average streamflow from the North Elim River could supply the supplementary irrigation water for 1000 acres.
- (iii) The water from the South Elim River has a higher content of dissolved solids (electrical conductivity 930 micromohs) and it cannot be used unless it is mixed with better quality water.
- (iv) From the Black River water can be taken to irrigate the North Western part of the area. There is no limitation in the amount of water any time of the year.
- (v) For crops of short duration two crops per year could be obtained without irrigation, if sown at the appropriate time during the spring and fall seasons.
- (vi) The amount of water needed every month for irrigation depends on the area to be sowed by a particular crop in a given season.
- (vii) According to the spot level map, there is a convergence slope toward the Grass River Pumping Station. Taking as reference the 2D-1 Drain the land slopes as follows:

In the Northern Part

Left side from West to East up to drain 2D.

Right side from East to West up to drain 2D.

In the Southern Part

(There is a general slope from East to West)

Left side from South to North

Right side from North to South.

- (viii) Water from the Foster and Braes Rivers should be utilized when available.
- (ix) Water could be taken from the Black River at a point upstream from waterfall situated downstream (Newton).
- (x) Another possibility is to place a check dam upstream the meander to raise the water level and to get water to the peat area near the Grass River Pumping Station.
- (xi) An open canal conveying 35.3 cfs ($1m^3/s$) will feed the drains 2D-2, 2D-3 and 2D-4. Check dams should operate in the drains to raise the water level to give the water head for the infiltration of water into the peat soil.
- (xii) The existing three water intakes in the North Elim River will be used to divert the stream towards the North Central part of the area.
- (xiii) Water from the Foster River should be taken upstream the Foster Gauging Station to give the water enough elevations to irrigate as much land as possible.

7. Recommendations

- (i) To reduce the irrigation needs, the selected crops should be planted or sowed during the rain seasons, spring and fall when the effective rainfall supplies

The author would like to thank the editor and anonymous reviewers for their useful comments and suggestions.

$$(\partial_t^{\alpha} \partial_x^{\beta} u)(t,x) = \int_0^t \int_{\mathbb{R}^n} \frac{e^{-|x-y|}}{|t-s|^{n+\alpha}} \partial_x^{\beta} u(s,y) dy ds.$$

the necessary moisture to the soil.

- (ii) Irrigation should be provided for high profitable crops.
- (iii) The diversion structure, the conveyance canals and the irrigation facilities in the North Elim River should be improved to have as much water as possible to irrigate the land.
- (iv) On the land of steeper slope contour furrow for water conservation should be practiced.
- (v) A water table control should be managed permanently in the peat area through the drainage ditches and through the irrigation from the Black River.
- (vi) To irrigate the South Eastern part of the area, it will be necessary to use the underground water or water from the New River.
- (vii) A soil salinity control should be followed permanently in the area irrigated by the North Elim River because of its salt content.
- (viii) A topographic survey with contour lines every foot should be carried out followed by a land levelling to improve the water conservation and the irrigation efficiency.
- (ix) Observation wells should be installed in the area (especially in the Peat area) to monitor the water table fluctuation in space as well as in time.
- (x) To find out the benefits of irrigation, research on the relationship between Productivity and water applied should be conducted.
- (xi) For every type of soil and land slope the appropriate irrigation system should be designed to have a high water application efficiency.

the first time in the history of the world, the
whole of the human race has been gathered
together in one place.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

It is a great thing to have all the
people of the world gathered together.

- (xii) Checks with wooden sluice gates should be placed in drains 2D-2, 2D-3 and 2D-4 to moisture the peat soil of the North Western part of the area.
- (xiii) Groundwater studies should be carried out in the South part of the area to find out the water yield of the Aquifer and the possibility of drilling wells with a high productivity in order to irrigate this part of the area.

1. What is the best way to learn English?
The best way to learn English is to practice it as much as possible. This can be done by reading English books, listening to English music, watching English movies, and speaking English with native speakers. It's also important to immerse yourself in the language by living in an English-speaking country or by attending English-language classes.

2. How can I improve my English grammar?
To improve your English grammar, you should focus on learning the rules of the language. You can do this by studying grammar books, taking online courses, or working with a tutor. It's also helpful to practice writing and speaking English regularly, as this will help you to internalize the grammar rules.

3. What are some common mistakes made by non-native English speakers?
Some common mistakes made by non-native English speakers include mispronouncing words, using incorrect verb tenses, and failing to use punctuation correctly. Additionally, many non-native speakers struggle with idiomatic expressions and colloquialisms, which can be difficult to understand if you're not familiar with them.

4. How can I improve my English pronunciation?
To improve your English pronunciation, you should focus on practicing the sounds of the language. You can do this by listening to native speakers, repeating what they say, and working with a tutor who can help you to identify and correct any pronunciation errors.

5. What are some tips for learning English vocabulary?
One tip for learning English vocabulary is to read English books and articles regularly. This will expose you to new words and help you to learn them in context. Another tip is to use flashcards or apps to memorize new words and their meanings. It's also helpful to practice using new words in your own writing and speaking.

6. How can I improve my English listening skills?
To improve your English listening skills, you should practice listening to English as much as possible. This can be done by listening to English music, watching English movies, and speaking English with native speakers. It's also helpful to practice listening to English news programs or podcasts, as this will help you to become more familiar with the language.

7. What are some common mistakes made by non-native English speakers in writing?
Some common mistakes made by non-native English speakers in writing include misspellings, punctuation errors, and grammatical mistakes. Additionally, many non-native speakers struggle with sentence structure and organization, which can make their writing difficult to understand.

8. How can I improve my English writing skills?
To improve your English writing skills, you should practice writing as much as possible. This can be done by keeping a journal, writing short stories, or working on longer projects like essays or reports. It's also helpful to get feedback from native speakers or a tutor, who can help you to identify and correct any mistakes in your writing.

9. What are some tips for learning English grammar?
One tip for learning English grammar is to study the rules of the language. You can do this by reading grammar books, taking online courses, or working with a tutor. It's also helpful to practice writing and speaking English regularly, as this will help you to internalize the grammar rules.

10. How can I improve my English pronunciation?
To improve your English pronunciation, you should focus on practicing the sounds of the language. You can do this by listening to native speakers, repeating what they say, and working with a tutor who can help you to identify and correct any pronunciation errors.
